PHILIPS

Data handbook

PHILIPS Electronic components and materials

Electron tubes

Book T1 1985

Tubes for r.f. heating

Elcoma – Philips Electronic Components and Materials Division – embraces a world-wide group of companies operating under the following names:

IBRAPE
MBLE
Miniwatt
Mullard
PHILIPS
RTC
signetics
VALVO

Elcoma offers you a technological partnership in developing your systems to the full. A partnership to which we can bring

- world-wide production and marketing
- know-how
- systems approach
- continuity
- broad product line
- fundamental research
- leading technologies
- applications support
- quality

TUBES FOR R.F. HEATING

DATA HANDBOOK SYSTEM

Our Data Handbook System comprises more than 60 books with specifications on electronic components, subassemblies and materials. It is made up of four series of handbooks:

ELECTRON TUBES	BLUE
SEMICONDUCTORS	RED
INTEGRATED CIRCUITS	PURPLE
COMPONENTS AND MATERIALS	GREEN

The contents of each series are listed on pages iv to viii.

The data handbooks contain all pertinent data available at the time of publication, and each is revised and reissued periodically.

When ratings or specifications differ from those published in the preceding edition they are indicated with arrows in the page margin. Where application information is given it is advisory and does not form part of the product specification.

Condensed data on the preferred products of Philips Electronic Components and Materials Division is given in our Preferred Type Range catalogue (issued annually).

Information on current Data Handbooks and on how to obtain a subscription for future issues is available from any of the Organizations listed on the back cover.
Product specialists are at your service and enquiries will be answered promptly.

ELECTRON TUBES (BLUE SERIES)

The blue series of data handbooks comprises:

T1 **Tubes for r.f. heating**

T2a **Transmitting tubes for communications, glass types**

T2b **Transmitting tubes for communications, ceramic types**

T3 **Klystrons, travelling-wave tubes, microwave diodes**

ET3 **Special Quality tubes, miscellaneous devices** (will not be reprinted)

T4 **Magnetrons for microwave heating**

T5 **Cathode-ray tubes**
Instrument tubes, monitor and display tubes, C.R. tubes for special applications

T6 **Geiger-Müller tubes**

T7 **Gas-filled tubes**
Segment indicator tubes, indicator tubes, dry reed contact units, thyratrons, industrial rectifying tubes, ignitrons, high-voltage rectifying tubes, associated accessories

T8 **Picture tubes and components**
Colour TV picture tubes, black and white TV picture tubes, colour monitor tubes for data graphic display, monochrome monitor tubes for data graphic display, components for colour television, components for black and white television and monochrome data graphic display

T9 **Photo and electron multipliers**
Photomultiplier tubes, phototubes, single channel electron multipliers, channel electron multiplier plates

T10 **Camera tubes and accessories**

T11 **Microwave semiconductors and components**

T12 **Vidicons and Newvicons**

T13 **Image intensifiers**

T14 **Infrared detectors**

T15 **Dry reed switches**

(T12–T15:) Data collations on these subjects are available now. Data Handbooks will be published in 1985.

T16 **Monochrome tubes and deflection units**
Black and white TV picture tubes, monochrome data graphic display tubes, deflection units

SEMICONDUCTORS (RED SERIES)

The red series of data handbooks comprises:

S1 **Diodes**
Small-signal germanium diodes, small-signal silicon diodes, voltage regulator diodes (< 1,5 W), voltage reference diodes, tuner diodes, rectifier diodes

S2a **Power diodes**

S2b **Thyristors and triacs**

S3 **Small-signal transistors**

S4a **Low-frequency power transistors and hybrid modules**

S4b **High-voltage and switching power transistors**

S5 **Field-effect transistors**

S6 **R.F. power transistors and modules**

S7 **Surface mounted semiconductors**

S8 **Devices for optoelectronics**
Photosensitive diodes and transistors, light-emitting diodes, displays, photocouplers, infrared sensitive devices, photoconductive devices.

S9 **Power MOS transistors**

S10 **Wideband transistors and wideband hybrid IC modules**

S11 **Microwave semiconductors** (to be published in this series in 1985)
All present available in Handbook T11

S12 **Surface acoustic wave devices**

INTEGRATED CIRCUITS (PURPLE SERIES)

The purple series of data handbooks comprises:

EXISTING SERIES

IC1 **Bipolar ICs for radio and audio equipment**

IC2 **Bipolar ICs for video equipment**

IC3 **ICs for digital systems in radio, audio and video equipment**

IC4 **Digital integrated circuits**
CMOS HE4000B family

IC5 **Digital integrated circuits – ECL**
ECL10 000 (GX family), ECL100 000 (HX family), dedicated designs

IC6 **Professional analogue integrated circuits**

IC7 **Signetics bipolar memories**

IC8 **Signetics analogue circuits**

IC9 **Signetics TTL logic**

IC10 **Signetics Integrated Fuse Logic (IFL)**

IC11 **Microprocessors, microcomputers and peripheral circuitry**

NEW SERIES

IC01N	**Radio, audio and associated systems** Bipolar, MOS	
IC02N	**Video and associated systems** Bipolar, MOS	
IC03N	**Telephony equipment** Bipolar, MOS	
IC04N	**HE4000B logic family** CMOS	
IC05N	**HE4000B logic family uncased integrated circuits** CMOS	(published 1984)
IC06N	**PC54/74HC/HCU/HCT logic families** HCMOS	
IC07N	**PC54/74HC/HCU/HCT uncased integrated circuits** HCMOS	
IC08N	**10K and 100K logic family** ECL	(published 1984)
IC09N	**Logic series** TTL	(published 1984)
IC10N	**Memories** MOS, TTL, ECL	
IC11N	**Analogue - industrial**	
IC12N	**Semi-custom gate arrays & cell libraries** ISL, ECL, CMOS	
IC13N	**Semi-custom integrated fuse logic** IFL series 20/24/28	
IC14N	**Microprocessors, microcontrollers & peripherals** Bipolar, MOS	
IC15N	**Logic series** FAST TTL	(published 1984)

Note

Books available in the new series are shown with their date of publication.

COMPONENTS AND MATERIALS (GREEN SERIES)

The green series of data handbooks comprises:

C1 **Programmable controller modules**
PLC modules, PC20 modules

C2 **Television tuners, video modulators, surface acoustic wave filters**

C3 **Loudspeakers**

C4 **Ferroxcube potcores, square cores and cross cores**

C5 **Ferroxcube for power, audio/video and accelerators**

C6 **Synchronous motors and gearboxes**

C7 **Variable capacitors**

C8 **Variable mains transformers**

C9 **Piezoelectric quartz devices**
Quartz crystal units, temperature compensated crystal oscillators, compact integrated oscillators, quartz crystal cuts for temperature measurements

C10 **Connectors**

C11 **Non-linear resistors**
Voltage dependent resistors (VDR), light dependent resistors (LDR), negative temperature coefficient thermistors (NTC), positive temperature coefficient thermistors (PTC)

C12 **Variable resistors and test switches**

C13 **Fixed resistors**

C14 **Electrolytic and solid capacitors**

C15 **Ceramic capacitors***

C16 **Permanent magnet materials**

C17 **Stepping motors and associated electronics**

C18 **D.C. motors**

C19 **Piezoelectric ceramics**

C20 **Wire-wound components for TVs and monitors**

C21 **Assemblies for industrial use**
HNIL FZ/30 series, NORbits 60-, 61-, 90-series, input devices

* Film capacitors are included in Data Handbook C22 which will be published in 1985. The September 1982 edition of C15 should be retained until C22 is issued.

GENERAL SECTION

RATING SYSTEM

(in accordance with IEC Publication 134)

ABSOLUTE MAXIMUM RATING SYSTEM

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, which should not be exceeded under the worst probable conditions.

These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply variation, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

LIST OF SYMBOLS

a	Anode
B	Bandwidth; magnetic flux density
bp	Beam plates
C_a	Capacitance between anode and all other electrodes
C_{af}	Capacitance between anode and filament (all other electrodes being earthed)
C_{ag}	Capacitance between anode and grid (all other electrodes being earthed)
C_{ak}	Capacitance between anode and cathode (all other electrodes being earthed)
C_{gf}	Capacitance between grid and filament (all other electrodes being earthed)
C_{g1g2}	Capacitance between these two grids (all other electrodes being earthed)
C_{gk}	Capacitance between grid and cathode (all other electrodes being earthed)
C_i	Input capacitance
C_n	Neutralizing capacitance
C_o	Output capacitance
d	Harmonic distortion factor
d_n	n-th order intermodulation products
d_{tot}	Total harmonic distortion
f	Filament or heater; frequency
f_c	Filament or heater centre tap
f(k)	Filament (and cathode) r.f. connection
g	Grid
G	Power gain
h	Height above sea level
I_a	D.C. anode current
i.c.	Tube pin which must not be connected externally
I_f	Filament or heater current
I_g	D.C. grid current
I_k	D.C. cathode current
IMP	Inter modulation products
I_p	Peak value of a current
k	Cathode
m	Modulation factor
p	Pressure
p_i	Pressure drop of cooling air or cooling water
q	Rate of flow of cooling air or cooling water
R_a	Anode output a.c. resistance
R_{aa}	Anode to anode a.c. resistance
R_{fo}	Filament or heater resistance in cold condition
R_g	External grid resistor

R_k	External cathode resistor
R_{th}	Thermal resistance
s	Internal shield
S	Transconductance
T	Temperature
t	Duration
T_a	Temperature of anode body
T_{amb}	Ambient temperature
T_{bulb}	Bulb temperature
T_{env}	Envelope temperature
T_i	Inlet temperature of cooling air or cooling water
t_p	Pulse duration
T_o	Outlet temperature of cooling air or cooling water
T_{pin}	Pin temperature
T_s	Seal temperature
t_w	Waiting time (time which has to elapse between switching on the filament or heater voltage and switching on of the other voltages)
V_a	D.C. anode voltage
$V_{a\sim}$	Amplitude anode a.c. voltage
V_f	Filament or heater voltage
V_g	D.C. grid voltage
$V_{g\sim}$	Amplitude grid a.c. voltage
V_{kf}	Voltage between cathode and heater
V_p	Peak value of a voltage
V_{rms}	Root mean square value of a voltage
V_{tr}	Secondary transformer voltage
W_a	Anode dissipation
W_{dr}	Driving power
W_g	Grid dissipation
W_i	Input power
W_ℓ	Output power in the load
W_{mod}	Modulation power
W_o	Anode output power
W_{oPEP}	Peak envelope output power
W_{osc}	Oscillator output power
W_{Rg}	Grid resistor dissipation
δ	Duty factor
η	Efficiency
η_a	Anode efficiency
η_{osc}	Oscillator efficiency
λ	Wavelength
μ	Amplification factor
μ_{g2g1}	Amplification factor of grid 2 with respect to grid 1.

GENERAL OPERATIONAL RECOMMENDATIONS

1 PREFACE

1.1 In this handbook, data and curves are given for transmitting tubes for communications and tubes for r.f. heating.

1.2 The tubes are classified as follows:

D = **Design type.** Recommended for equipment design; production quantities available at date of publication.

C = **Current type.** No longer recommended for equipment design; available for equipment production and for use in existing equipment.

M = **Maintenance type.** No longer recommended for equipment production; available for maintenance of existing equipment.

O = **Obsolescent type.** Available until present stocks are exhausted.

Obsolescent types of which all stocks are exhausted are called **obsolete**; any data still published on these types is for reference purposes only.

The status of all types is given in a type survey at the end of the general section, together with data in condensed form. Full details are given of design and current types, divided into chapters as mentioned on the title page.

1.3 The characteristic data is general and independent of specific applications. This data, such as filament/heater current, amplification factor, transconductance and capacitances is given for a typical tube.

2 CHARACTERISTIC DATA

2.1 Inter-electrode capacitances

The published values of capacitances are average values measured on the cold tube with no operating voltages; individual deviations may however occur. The definitions of the capacitance symbols are given in the appropriate list in **IEC publication 100.**

2.2 Amplification factor μ and transconductance S

The published values are average values and individual deviations may occur. The conditions at which the values have been measured are stated.

2.3 Accessories

Proper functioning of the tubes can be guaranteed only if accessories (sockets, cooling devices etc.) have been supplied, or approved, by the tube manufacturer.

3 FILAMENT/HEATER SUPPLY

3.1 General

The published value of filament/heater voltage is that which should be present at the tube terminals. Filaments fed with direct current should have their supply polarity reversed at regular intervals (say monthly) to ensure uniform wear of the filament with consequent longer life. Reduction of filament/heater voltage is sometimes recommended to compensate for heating by back-bombardment at high frequencies; see the relevant data sheets. Special precautions must be taken when operating the filaments/heaters of transmitting tubes in series and the manufacturer should be consulted before doing so.

3.2 Quick heating cathodes (filaments)

In general, tubes with quick heating cathodes should have their filaments only in parallel. When a sinusoidal voltage is used for heating the filament, the frequency must not be in the range 200 Hz to 5000 Hz. In addition, if a non-sinusoidal voltage from a d.c./a.c. converter is used, the r.m.s. value should be adjusted to the published value of filament voltage.
If required, the heating time may be further reduced by applying a higher value for a short time. The manufacturer should be consulted before doing so.

3.3 Indirectly heated oxide coated cathodes

To achieve satisfactory life, the heater voltage should be maintained within +1% and −3% of the published value. Excessive deviation over a long period from these limits will be harmful. Occasional temporary deviations should not exceed ±10%. In order to avoid heater cathode r.f. damage, the heater to cathode insulation and the heater itself should be decoupled for r.f.

3.4 Switching on the filament

Switching on at full filament voltage is permissible unless a maximum switch-on value of filament current is stated in the data sheet. For the published values of maximum permissible filament current during switch-on, refer to the absolute maximum of the instantaneous value under worst case conditions.

3.5 By-passing the filament

Tubes with directly heated cathodes must have the filament terminals at the same r.f. potential. For this purpose it is usual to connect a capacitor which has low reactance with respect to the operating frequency, close to and between the filament terminals. As an added safety precaution, it should be ensured that the resonance of this capacitor together with the inductance of the filament structure, falls well below the operating frequency.

3.6 Switching on electrode voltages

Unless stated otherwise (e.g. cathode heating time t_W), simultaneous switching on of filament, control grid, anode and screen grid voltages is permissible for tubes with an internal anode. Tubes with an external anode should in general not have their positive voltages applied until the cathode has reached its operating temperature. This can be checked by monitoring the filament current.

3.7 Effective cathode

If both filament limbs are marked 'f' in the data sheets, the filament may be regarded as being symmetrical in its function as cathode. If such a filament is fed with d.c. the anode return lead should be connected to the negative end of the filament. All other decoupling and circuit returns must then also be connected to this point.
If the filament is fed with a.c., the anode return lead should be connected to the centre-tap of the filament transformer or to a tapped resistor shunted across the filament. The filament decoupling will then be symmetrical with regard to this point and all other circuit returns must also be made to this point.

Effective cathode (continued)

If one filament limb is marked 'f' and the other 'f(k)', only the one marked 'f(k)' may be used as the circuit cathode. If such a filament is fed with d.c., the negative side of the filament supply should be connected to this point.
For either d.c. or a.c. filament supply, the anode supply, as well as decoupling and other circuit returns, must be connected to 'f(k)' only.

4 INITIAL OPERATION OF TUBE

4.1 Switching on the heater voltage

Ensure that any necessary cooling system is operative.

Sections 3.6 and 3.8 are applicable. The grid bias may be applied simultaneously.

4.2 Conditioning a tube

Conditioning is recommended for new tubes, after transit and after a period of storage. It is carried out by running the filament/heater only for at least 15 minutes before energizing the other electrodes, see also section 5.6.
Industrial tubes with anode voltages above 5 kV should also be operated for approximately 15 minutes at reduced anode voltage before applying full input ($V_a \times I_a$).
Television triodes and tetrodes may be operated for 15 minutes with the specified anode current in a no-signal condition. This treatment will remove any traces of gases which could cause premature failure of the tube.

4.3 Application of screen grid voltage to tetrodes

The screen grid voltage, V_{g2}, should be applied only when the anode voltage is present. If the anode voltage is removed, a safety circuit in the anode supply should cause the simultaneous removal of drive and screen grid voltages. If high voltage transients are present, it may be necessary to protect the cathode and control grid from arcing by means of a spark gap or protection diode across the relevant electrodes.

5 LIMITING VALUES

5.1 Notation

Limiting values are the maximum or minimum permissible values of the parameters listed. These limits are given either for all operating conditions together, or for an individual application.
The limiting values are applicable up to the maximum frequency stated. When operating at higher frequencies the limiting values must be decreased in accordance with the published figures or curves.

5.2 Derating of limiting values

If no limiting values have been published for a specific application, the derating factors listed in the following table must be applied. The values for class C telegraphy have been expressed as unity; the limiting values for other applications have been expressed as a factor of this unity.
A rectified 3-phase supply with or without filtering is equivalent to a d.c. supply.
The derating factors are determined by the physical limits of the tube and contain no safety margins. Where mains voltage fluctuations occur, further derating must be applied (see section 5.4). The nature of operation, e.g. industrial applications of heating generators, may necessitate further safety derating.

Table

	V_a	I_a	I_g	W_{ia}	W_a	W_{g2}
R.F. class C telegraphy	1	1	1	1	1	1
Anode modulation	0,8	0,833	1	0,67	0,67	0,67
R.F. class B	1	0,833	1	0,833	1	0,67
A.F. class B	1	1	1	1	1	1
A.F. class AB	1	1	1	1	1	1
A.F. class A	1	1		W_a	1	1
Self-rectifying oscillator	1,13	0,53	0,53	0,665	1	
Two-phase half-wave without filter	0,9	0,89	0,89	1	1	

5.3 Rating system

The limiting values should be used in accordance with the 'Absolute maximum rating system' as defined by IEC publication 134.

5.4 Absolute maximum rating system

Absolute maximum ratings are limiting values of operating and environmental conditions applicable to any electronic device of a specified type as defined by its published data, which should not be exceeded under the worst probable conditions.
These values are chosen by the device manufacturer to provide acceptable serviceability of the device, taking no responsibility for equipment variations, environmental variations, and the effects of changes in operating conditions due to variations in the characteristics of the device under consideration and of all other electronic devices in the equipment.

Absolute maximum rating system (continued)

The equipment manufacturer should design so that, initially and throughout life, no absolute maximum value for the intended service is exceeded with any device under the worst probable operating conditions with respect to supply voltage variation, equipment component variation, equipment control adjustment, load variations, signal variation, environmental conditions, and variations in characteristics of the device under consideration and of all other electronic devices in the equipment.

5.5 Limiting values

Each limiting value should be regarded independently of other values; under no circumstance is any limiting value to be exceeded (e.g. if the anode voltage is decreased to a value lower than its limiting value, it is not permissible to exceed the limiting value of anode current or anode dissipation).

5.6 Electrode voltages

The voltages (V_a, V_{g1}, V_{g2} etc.) listed under limiting values should not be exceeded even with a cold tube. Special attention should be paid to this point when a screen grid is supplied via a series resistor.
When designing equipment to be operated from an unstabilized mains supply, the maximum mains voltage which occurs determines the nominal operating voltages of the tube. These nominal voltages must be lower than the limiting values. Should the tube and thus the voltage supply, be temporarily under a lower load, these voltages may rise and these increased values, occurring at the highest mains voltage, determine the nominal operating voltages.
The limiting values of voltage are d.c. values. If an a.c. or an unsmoothed d.c. supply is used, the limiting values must be decreased in accordance with the derating factors shown in the table (section 5.2.).

5.7 Anode dissipation

The limiting value of the anode dissipation, W_a, should not be exceeded when fluctuations in the mains supply voltage occur, or when grid drive fails. To prevent damage to the tube in the latter case, adequate fixed bias or a quick action relay in the anode lead should be provided. When forced-air or water cooling is sufficient only for an anode dissipation smaller than the absolute maximum, the smaller value must be regarded as the limiting value.

5.8 Anode input power

Usually the data sheets show the limiting value of input power W_{ia} to be smaller than the product of limiting values of anode voltage and anode current; the latter two limits should not therefore occur simultaneously.
In practice, the input power W_{ia} is not always the product of the d.c. values of I_a and V_a. For pulsating supply voltages the form factor should be taken into account.

5.9 Screen grid dissipation, W_{g2}

The screen grid dissipation is the product of screen grid voltage and current. The screen grid should be protected against failure of anode voltage, see also section 4.3.

5.10 Control grid dissipation

The control grid dissipation W_g or W_{g1} can be approximated by subtracting the power supplied to the grid bias source ($-V_g \times I_g$) from the grid driving power (approx. $0.95 \times V_{gp} \times I_g$). When an a.c. or unsmoothed d.c. voltage supply is used, the form factor should be taken into account, see table in section 5.2 with the necessary derating factors.

5.11 Grid resistor

The maximum value of grid resistor, R_g max. (when published) should not be exceeded. This value is the maximum d.c. resistance in the grid circuit. A higher value may cause instability.

6 OPERATING CONDITIONS

6.1 General

In the published data, operating conditions for various applications have been given, stating the maximum frequency at which the conditions apply. If it is required to operate a tube at higher frequencies, the manufacturer should be consulted. The published values of operating conditions are average values derived from measurements made on a number of tubes of the same type, operating at optimum conditions.

Thus, small deviations from the published value may occur if measurements are made on an individual tube. However, some of the measured values of voltage or current must be adjusted to give the published figure. For example, the published value of output power is an average value which can be reached in practice by adjusting the r.f. or a.f. input voltage V_{gp}, when the published value of output power is not obtained at the nominal value of V_{gp}. When designing a multi-stage transmitter it is good practice to leave a margin in the output power and input voltage to allow for adjustments similar to that just described.

The published output power W_o of transmitting tubes is the tube's output, which may be determined by subtracting the anode dissipation W_a from the anode input W_{ia}. When a tube is used in a common grid circuit (grounded grid), the published value of the output power includes the power transferred from the driver.

Unless otherwise stated, losses in the anode circuit and coupling losses are not taken into account. The quoted grid input power is assumed to be 0,95 x the product of the average grid current I_g and the positive amplitude of the grid voltage $V_{g\sim}$. Losses in the grid circuit and the bleeder are sometimes accounted for by stating the required driver output power.

At high frequencies where reduced ratings have to be applied, the required driving power will often be considerably higher than the grid input power, due to circuit losses.

6.2 R.F. class C telegraphy and F.M. telephony

A class C amplifier or oscillator is one in which the grid bias is appreciably greater than the cut-off voltage so that current flows for less than one half of each cycle of the alternating grid voltage. Working to the published operating conditions will ensure good output power and efficiency.

If a grid resistor is used for obtaining automatic bias, care must be taken that the anode current does not become too high if the r.f. driving power should fail. A safety device in the anode or screen grid lead should be incorporated for this purpose.

6.3 R.F. class C anode and screen grid modulation

In an r.f. class C anode modulated stage the anode voltage is modulated with a.f. and at 100% modulation the voltage is varied from zero to twice the d.c. value. The average values of grid bias and r.f. driving voltage remain constant during modulation. With 100% modulation the average anode dissipation is 1,5 times the value without modulation and this is taken into account, although the published limiting value of anode dissipation refers to the unmodulated power.

6.4 R.F. class B telephony

A class B amplifier is one in which te grid is biased to the cut-off voltage so that the anode current flows for approximately one half of each cycle of the alternating grid voltage. The published data for r.f. class B telephony has been determined experimentally to give a linear modulation characteristic.

6.5 Industrial operating conditions

With a single phase mains supply, smoothing will sometimes be omitted as is normal in a three phase mains supply. Operating conditions and derating factors are given for this kind of operation (section 5.2.). It must be ensured that no limiting values are exceeded because of fluctuations in the mains supply or by tolerances in other components. The published value of W_o is the actual tube output power. The output power of a self-oscillating circuit W_{osc} is obtained by subtracting the grid dissipation W_g and the losses in the grid resistor W_{Rg} from the output power W_o. The power in the load W_l is obtained by subtracting the losses in the output circuit from W_{osc}. A favourable load output characteristic may be obtained by automatically controlling the grid voltage and current, depending on the matching. A non-linear device e.g. a tungsten lamp or a PTC thermistor may be used to perform this function adequately and help to prevent overloading the grid.

With self-oscillating circuits, the frequency must be held within the available frequency band. This may be done by having large circuit capacitance, small stable self inductance, undercritical inductive coupling with the output circuit, electrostatic screening between oscillator and output circuit, etc. If the frequency of an industrial generator is restricted to a very narrow band, crystal controlled driver stages may have to be used. It will then, however, be difficult to maintain a good match between tube and load over the whole of the processing cycle. Greater safety margins will have to be set for the tube, with the tube output very dependent on variations in the load. Special measures, such as automatic tuning and/or load matching, may have to be taken.

For smaller tubes in industrial applications, operating conditions have been given for an anode supply from a single phase full-wave rectifier, a three phase half-wave rectifier (which is nearly equivalent to d.c.) and with raw a.c. In the latter case the output is about 0,6 times that obtained with d.c. and the peak inverse voltage is equal to the full anode voltage. With a single-phase, full-wave rectified anode voltage the useful output is nearly equal to that with a d.c. supply.

6.6 Intermittent service

When data concerning intermittent service is published, it is conditional that, although the cathode may be heated continuously, the on-period is no more than 5 minutes and that the off-period is equally long or longer.

7 COOLING

7.1 Temperature limits

The maximum temperatures given in the data should be heeded and operating temperatures should be kept well below these values in the interest of tube life. Surface (envelope) temperatures may be checked with the help of suitable thermocouples, thermocrayons, thermopaints or stick-on markers.

7.2 Cooling of the tube header

In order to maintain all parts of the tube header, i.e. contact surfaces and ceramic to metal or glass to metal seals, at temperatures below the limits given in the data, it may be necessary, depending on the surroundings and ambient temperatures, to provide some extra cooling even at low frequencies. At frequencies above 4 MHz such extra cooling becomes mandatory for all types. For this purpose an axial air stream is preferred since this will ensure a more even temperature around the circumference of the individual electrodes. This will already be assisted by also ensuring an even distribution of the high frequency currents around the seals.

7.2.1 Forced air cooled tubes

The anode cooler air will in most cases also effectively cool the seals, provided it is directed in such a way that the seals are not protected from this air stream.

7.2.2 Water cooled tubes

Unless environmental conditions make it necessary, additional cooling of the seals will be mandatory only at frequencies above 4 MHz. If some of the cooling water can be branched off, this may also serve as coolant through pipes that are in good thermal contact with the respective connectors. Such pipes are already integral with the filament connectors of industrial types YD1192 to YD1432. Their use with a reliable water flow is strongly recommended.

7.3 Minimum coolant quantities

When determining the minimum coolant flow through the cooler, account must be taken of the maximum inlet temperature and the maximum anode dissipation that may occur under the prevailing circumstances.

7.3.1 Minimum forced air flow

The temperature, dissipation and flow relationships are given in the published data, tables and curves. The temperature rise of the cooling air may be found from the following formula:

$$\Delta T = \frac{50 \times W_{tot}}{Q}$$

where Q = air flow in m^3/min

W_{tot} = anode + grid + filament dissipation in kW

ΔT = temperature rise in K

This formula holds for an ambient temperature of 20 ^{o}C at sea level. Whenever the ambient conditions (temperature, altitude) are beyond those shown in the published data, the tube supplier must be consulted.

7.3.2 Minimum cooling water flow

The amount of cooling water required is given in the published data. The temperature rise of the cooling water may be found from the following formula:

$$\Delta T = \frac{14,4 \times W_{tot}}{Q}$$

where Q = water flow in litres/min
W_{tot} = anode + grid + filament dissipation in kW
ΔT = temperature rise in K

7.4 Natural cooling

This is applicable only to internal anode glass envelope tubes with a maximum anode dissipation of up to about 1 kW. A chimney around and extending above the tube will assist natural convection. For operation at higher frequencies additional cooling of the electrode pins, the tube socket and the bulb is often required. Temperature checks may be carried out as noted in section 7.1.

7.5 Forced air cooling

When using air as a cooling medium the intake must be properly filtered to prevent blockage of the anode radiator. All electrical supplies to the tube should be interlocked with a flow sensor in the exhaust stream. Temperature checks may be carried out as noted in section 7.1.

→ **7.6 Water cooling**

The direction of water flow, indicated by arrows near the water inlets and outlets of the tube are for when the tube is mounted 'anode down'. When reversing the position of the tube, i.e. 'anode up', the direction of flow should be reversed. Re-circulating systems are preferred, since, apart from saving water, they help to ensure a high standard of purity.
Some of the requirements for satisfactory cooling water are that it should not be corrosive or deposit scale, should not contain insoluble material that might cause blockages and should have a high electrical resistance to prevent electrolysis. Its mineral content and electrical conductivity should therefore be periodically checked, especially when it is not drawn from a circulating system.
In general a non-corrosive water should be low in chlorides, and dissolved oxygen and carbon dioxide.
Scale formation may be avoided by maintaining a low amount of silica and bicarnonates, especially calcium bicarbonate. The total carbonate hardness should not exceed a value of 6^{o} dH.
No exact figures can be given for impurities as they are interdependent.
However, in a circulating system the water should be as free as possible from all solid matter, and the dissolved oxygen content should be low. Whenever possible a closed water system using destilled or demineralized water should be employed. In this case the following should be added:

1. 700 mg of a 24% solution hydrazin hydrate (approx. 0,7 ml per litre of water) to avoid corrosion.
2. Approximately 700 mg sodium silicate per litre of water to increase the pH value (hydrogen ion concentration).

7 **COOLING** (continued)

The additives will reduce the electrical conductivity of the water well below 300 $\mu\Omega^{-1}cm^{-1}$ (resistivity > 3,3 kΩ per cm^3) and also increase the pH value. (A pH value of 7 to 9 is recommended). It is also recommended that the quality of the cooling water be checked after starting operations, and at regular intervals thereafter.

The cooling water must also be free from all traces of greasy substances since a small amount may form a dangerous heat barrier on the anode cooler, causing excessive anode temperatures despite an apparently adequate water flow. These greasy or oily films may be removed by repeated flushing of the cooling channels with a domestic liquid detergent or slightly soapy water to which a small quantity of industrial alcohol and 33% ammonia has been added (approx. 10 ml of each per litre of water). The cleaning process should be completed by repeated flushing with demineralized water. The cause of such greasy deposits will usually be found elsowhere in the cooling system as a result of, for example, leaking pump glands. After the necessary repairs have been carried out, the whole system must be cleaned in a similar manner to prevent deposits forming again. The cooling water system must be interlocked with all electrical supplies to the tube. As an added safeguard, the interlocks should be activated if the water outlet temperature exceeds the indicated upper limit. To prevent the tube from running dry in the event of minor leakages in the system, the reservoir should always be above the level of the tube.

8 CHECKING PROTECTION OF THE TUBE

To verify the operation of the safety circuits noted in section 4.3, as well as safeguarding against high and possibly destructive currents resulting from excessive transients, the following functional check is recommended.
With the tube removed, the anode supply lines (anode - cathode) are shorted at the tube position with a copper wire that is of a specified diameter for the tube type used (see table below) and has a length of approx. 2,5 cm per kV of applied anode potential. If this test wire does not fuse upon application of the full high tension, the speed of the safety circuit is adequate to protect the tube.

tube	testwire dia mm	tube	testwire dia mm	tube	testwire dia mm

9 CONNECTORS

9.1 Clean contact surface

Attention must be paid to a good fit on a clean contact surface of all electrode connectors as well as an even r.f. current distribution around their circumference.

9.2 Fastening the filament connector on industrial tubes

To ensure good seating of the filament connectors on industrial tubes, care should be taken that they are not crooked and that the applied clamping force is within the specified limits.
In the following table the minimum and maximum torque values are given for the different tubes concerned and the corresponding connector at room temperature.

Tube type	Cap dia. mm	Bolt size	Connector type	Min. torque Ncm	Max. torque Ncm
YD1170/77	25	M6	40692A	400	600
YD1180/87	32	M6	40708A	500	700
YD1190/97	42	M6	40705A	600	700
YD1202 YD1212 YD1342	54	M8	40695A	800	1000

After the system has been warmed up and cooled down several times, it is advisable to check the bolts for correct tightness and if necessary re-tighten to the correct value.

10 STORAGE AND MAINTENANCE

10.1 General

Whenever possible, the tubes should be transported and stored in their original packing in an upright position. If the tubes are to be stored in an unpacked condition they should be kept in a dry room placed in an upright position in a rack that is not subject to excessive vibration and does not exert any mechanical stress on other parts of the tube except those that normally serve for the support of the tube, e.g. the anode cooler or the anode mounting flange.
If a tube is stored for an extended period it should be subjected to the conditioning schedule outlined in section 4.2.
Care should be taken that the glass or ceramic parts of a tube are kept clean and do not contact metallic objects since a scratch on glass may initiate a fracture and metal rubbed against ceramic may leave a metallic trace that can lead to surface arcing when high tension is applied to the tube. Soiled glass parts may be cleaned with conventional non-abrasive window cleaning agents and thoroughly rinsed and dried afterwards. Soiled ceramic parts are best cleaned with domestic cleaning powders applied with a moistened tooth brush. A final thorough rinse with clean water is essential to remove all traces of the cleaning powder and the loosened dirt.

10.2 Cleaning integrally water cooled tubes

If the water cooling channels or the helix of a tube become partially blocked (reduced flow and increased back pressure) by floating particles, these can be removed with compressed air or high pressure water, taking care that the water outlet of the tube is open to air and the maximum applied inlet pressure does not exceed 50 Pa. If the impurities adhere to the cooling channel walls or are of a sedimentary nature the cleaning will have to be assisted by a solvent. In the majority of cases these will be calcium deposits. They may be removed by flushing the tube, if necessary repeatedly, with a 5 to 10% solution of hydrochloric acid or 15% citric acid. This procedure should be followed by thoroughly rinsing with distilled or demineralized water.

11 SAFETY ASPECTS

11.1 X-radiation

Power electron tubes operating at voltages in excess of 5 kV are possible sources of X-radiation, progressively so with increasing voltage levels. The envelope of the tubes offers only a limited shielding for such radiation. The equipment manufacturer should provide suitable additional shielding in his design.

The level of X-radiation should be checked periodically.

11.2 R.F.-radiation

Exposure to strong r.f. fields may cause health-hazard, progressively so with increasing frequency. As such fields will exist in the vicinity of power electron tubes, the equipment manufacturer should provide suitable shielding in his design to reduce r.f. fields, in the neighbourhood of the equipment, to acceptable levels.

HEATING: direct; filament thoriated tungsten

Filament voltage	V_f	=	6.3 V
Filament current	I_f	=	5.8 A

CAPACITANCES

Anode to all other elements except grid	C_a	=	0.1 pF
Grid to all other elements except anode	C_g	=	4.9 pF
Anode to grid	C_{ag}	=	5.0 pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	=	2500 V
Anode current	I_a	=	60 mA
Amplification factor	μ	=	25
Mutual conductance	S	=	2.8 mA/V

TEMPERATURE LIMITS

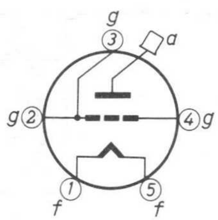
Absolute maximum rating system

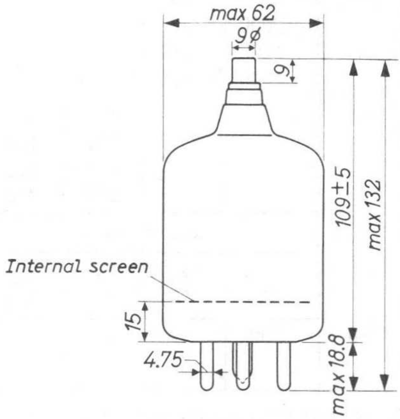
Temperature of anode seal	=	max.	220 °C
Bottom temperature	=	max.	180 °C

It is recommended to direct a low-velocity air flow on bottom and top seal if the tube is used at or near the limiting values at frequencies above 50 MHz.

MECHANICAL DATA

Base	giant 5 p
Socket	2422 512 01001
Anode connector	40624
Net mass	125 g





Mounting position vertical with base up or down

COOLING

Radiation/low-velocity air flow.

HEATING: direct, parallel supply; thoriated tungsten filament

Filament voltage	V_f	=	5 V
Filament current	I_f	=	14,1 A

The filament is designed to accept temporary fluctuations of +5% and −10%

CAPACITANCES

Anode to all other elements except grid	C_a	=	0,16 pF
Grid to all other elements except anode	C_g	=	6,3 pF
Anode to grid	C_{ag}	=	5,0 pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	=	3 kV
Anode current	I_a	=	90 mA
Mutual conductance	S	=	5 mA/V
Amplification factor	μ	=	25

* Two tubes.

TEMPERATURE LIMITS

Absolute maximum rating system

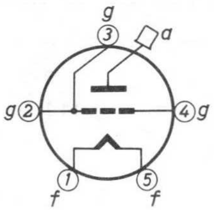
Bulb temperature	T_{bulb}	max.	350 °C
Anode seal temperature	T_a	max.	220 °C
Pin temperature	T_{pin}	max.	180 °C

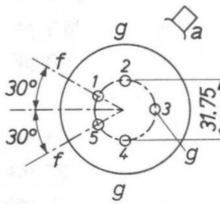
COOLING

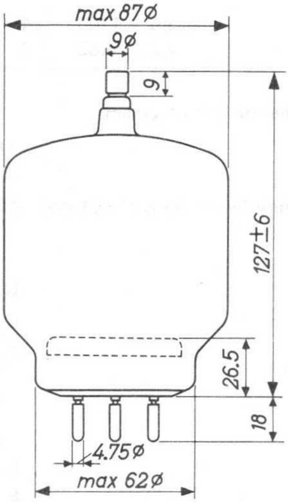
In cases where the maximum permissible temperatures are likely to be exceeded, as would normally be the case at frequencies above 30 MHz with full ratings, a low-velocity air flow has to be directed onto the anode seal and the bottom of the envelope. The cooling will be facilitated by the use of a blower and a glass chimney type 40666.

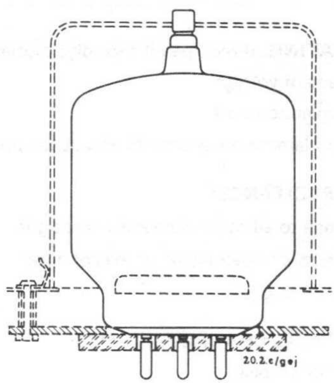
MECHANICAL DATA

Socket	2422 512 01001	Base	Giant 5 p.
Anode connector (clip)	40624	Net mass	190 g
Chimney	40666		









Mounting suggestion of tube with chimney.

Mounting position vertical with base up or down

In order to prevent overheating of the grid pins by high-frequency current it is recommended to include the three grid socket connections in the circuit.

HEATING: direct; filament thoriated tungsten

Filament voltage	V_f	=	10	V
Filament current	I_f	=	9.9	A

CAPACITANCES

Anode to all other elements except grid	C_a	=	0.17	pF
Grid to all other elements except anode	C_g	=	8.0	pF
Anode to grid	C_{ag}	=	7.0	pF

TYPICAL CHARACTERISTICS

Amplification factor	μ	=	28	
Mutual conductance	S (I_a = 125 mA)	=	4.5	mA/V

TEMPERATURE LIMITS (Absolute limits)

Temperature of anode seal	=	max. 220	°C
Temperature of bottom pin seals	=	max. 180	°C
Bulb temperature	=	max. 250	°C

1) Power transferred from driving stage included
2) Two tubes

COOLING

In general cooling of the tube is not necessary at normal ambient temperature at frequencies below 50 MHz.

When the tube is used at or near the limiting values at frequencies above 50 Mc/s, it will be necessary to direct a low-velocity air flow on the anode seal and the bottom of the envelope.

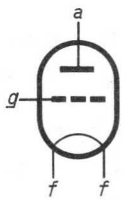
MECHANICAL DATA

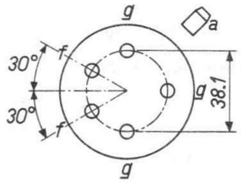
Dimensions in mm

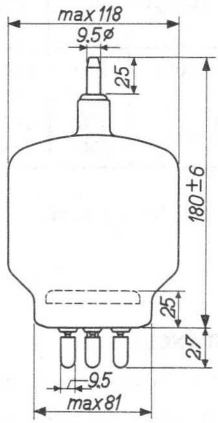
Socket : 2422 512 00001

Anode connector: 40626

Net mass : 420 g







Mounting position: vertical with base up or down

HEATING : direct; filament thoriated tungsten

Filament voltage	V_f	5	V
Filament current	I_f	32.5	A

The filament is designed to accept temporary fluctuations of +5 % and −10 %.

CAPACITANCES

Anode to filament	C_{af}	0.2	pF
Grid to filament	C_{gf}	7.5	pF
Anode to grid	C_{ag}	5.1	pF

CHARACTERISTICS measured at V_a = 4 kV, I_a = 120 mA

Transconductance	S	3.3	mA/V
Amplification factor	μ	21	

COOLING

In general cooling of the tube working at the published operating conditions with matched load is not necessary. When the tube is mounted in a small cabinet adequate ventilation must be provided.

At non-matched load, combined with the highest operating frequencies a low-velocity air flow on the tube is necessary. A small fan will suffice; it is recommended to mount the fan underneath the tube socket.

Anode dissipation	W_a	2,7	kW
Anode output power	W_o	6,3	kW
Anode efficiency	η_a	70	%
Oscillator efficiency	η_{osc}	67	%
Grid current, on load	I_g	0,4	A
Grid input power	W_{ig}	300	W

* With anode voltage from three-phase half-wave rectifier without filter.

LIMITING VALUES (Absolute max. rating system)

Frequency	f	up to	55	MHz
Anode voltage	V_a	max.	7	kV
Anode current	I_a	max.	1,8	A
Anode input power	W_{ia}	max.	11	kW
Anode dissipation	W_a	max.	6	kW
Grid voltage	$-V_g$	max.	1250	V
Grid current, on load	I_g	max.	0,5	A
off load	I_g	max.	0,7	A
Grid resistor	R_g	max.	10	kΩ
Temperature of filament seals	T	max.	210	^oC
Temperature of anode and grid seals	T	max.	180	^oC

HEATING: direct ; filament thoriated tungsten

Filament voltage	V_f	12,6	V
Filament current	I_f	33	A

The filament is designed to accept temporary fluctuations of +5% and −10%.

CAPACITANCES

Anode to all other elements except grid	C_a	0,3	pF
Grid to all other elements except anode	C_g	16	pF
Anode to grid	C_{ag}	11	pF

CHARACTERISTICS measured at V_a = 6 kV, I_a = 1 A

Transconductance	S	15	mA/V
Amplification factor	μ	32	

COOLING

W_a (kW)	T_i (°C)	q_{min} (l/min)	p_i (atm)	T_o (°C)
2	20	1,5	0,06	44
	50	3	0,22	62
4	20	3	0,22	42
	50	6	0,73	61
6	20	5	0,54	39
	50	10	1,8	59

Absolute max. water inlet temperature T_i max. 50 °C

At water inlet temperatures between 20 °C and 50 °C the required quantity of water can be found by linear interpolation.

In general no air cooling will be required at frequencies up to 30 MHz and at ambient temperatures below 35 °C. At higher temperatures or at higher frequencies a low velocity air flow to the grid and filament seals will be necessary.

ACCESSORIES

Filament connectors	type	**40634**
Connector for centre pin of the filament		40649
Grid connector	40650 or	40622

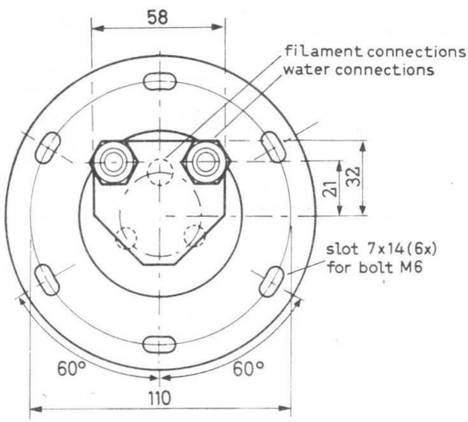
The centre filament pin f_c must not be used for filament current supply. The connector type 40649 should, however, be used for cooling of this pin.

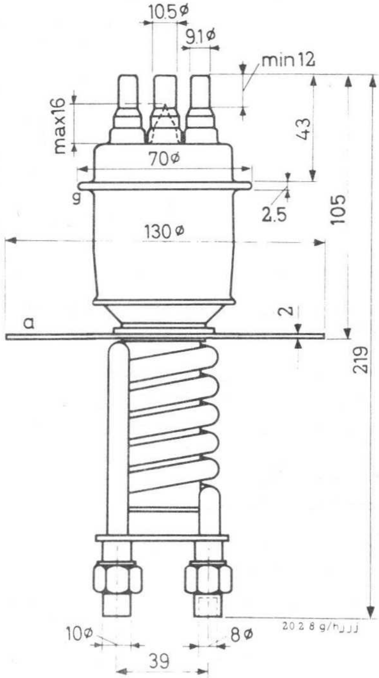
The grid connector type 40650 must not be used at frequencies higher than 30 MHz.

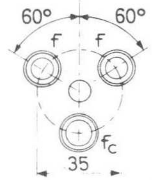
MECHANICAL DATA Dimensions in mm

Mounting position: vertical with anode down

Net **mass** : approx. 0, 8 kg







The use of wing nuts for the water connections should be avoided.

TYPICAL CHARACTERISTICS

Anode voltage	V_a	= 2000	V
Anode current	I_a	= 200	mA
Amplification factor	μ	= 33	
Mutual conductance	S	= 10	mA/V

TEMPERATURE LIMITS (Absolute limits)

Temperature of seal between filament terminals = max. 200 °C

Temperature of other seals = max. 250 °C

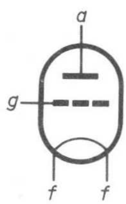
COOLING CHARACTERISTICS

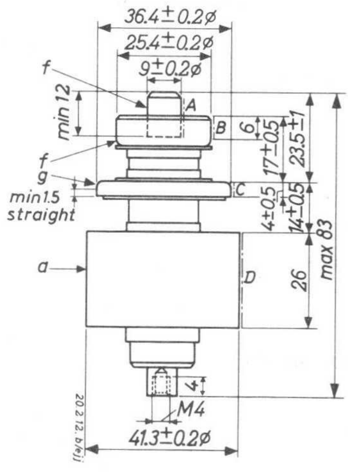
W_a (W)	h (m)	t_i (°C)	q_{min} (m^3/min)	p_i (mm H_2O)
400	0	45	0.65	12
	1500	35	0.65	12
	3000	25	0.65	12

The required quantity of air is independent of the anode dissipation and the frequency.

MECHANICAL DATA Dimensions in mm

Net weight: 157 g





Eccentricity of the electrode connections: The electrode connections A, B and C are within cylindrical surfaces having a diameter of 9.5, 25.9 and 36.9 mm respectively and being concentric with the cylindrical surface D.

Mounting position: vertical with the anode up or down.

R.F. CLASS C OSCILLATOR FOR INDUSTRIAL USE

LIMITING VALUES (Absolute limits)

Frequency	f	up to	470	900	MHz
Anode voltage	V_a	= max.	2200	2000	V

INDUSTRIAL R.F. POWER TRIODE

- Air cooled

QUICK REFERENCE DATA

Industrial r.f. oscillator, class-C

freq.	three phase	
	V_a	W_o
MHz	kV	kW
30	7	17,7
	6	14,3

HEATING: direct; thoriated tungsten filament

Filament voltage	V_f	=	6,3 V
Filament current	I_f	=	136 A
Cold filament resistance	R_{fo}	=	0,005 Ω

The filament is designed to accept temporary fluctuations of +5% and −10%

The filament current must never exceed a peak value of 280 A at any time during the initial energizing schedule.

CAPACITANCES

Anode to all other elements except grid	C_a	=	1,2 pF
Grid to all other elements except anode	C_g	=	44,5 pF
Anode to grid	C_{ag}	=	33,5 pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	=	6 kV
Anode current	I_a	=	2,5 A
Mutual conductance	S	=	23 mA/V
Amplification factor	μ	=	17,5

TEMPERATURE LIMIT (Absolute limit)

Temperature of all seals	max.	220 °C

COOLING

See also cooling curves, 1 mm $H_2O \approx 10$ Pa.

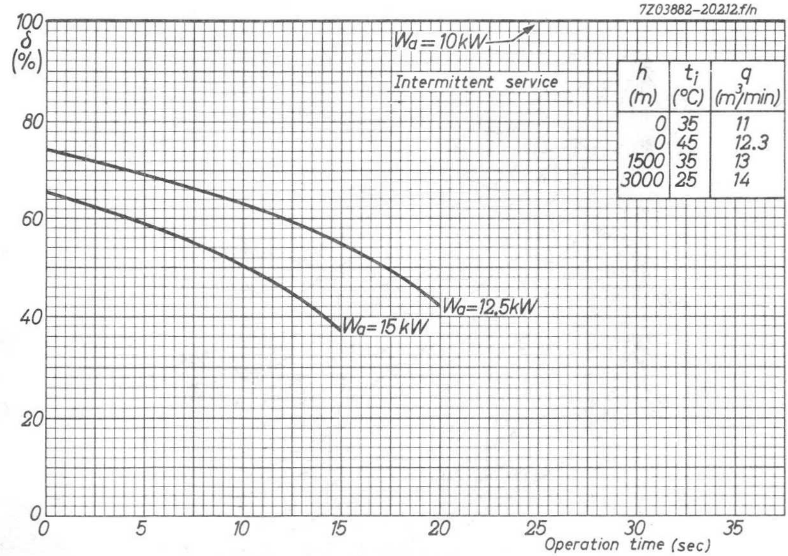
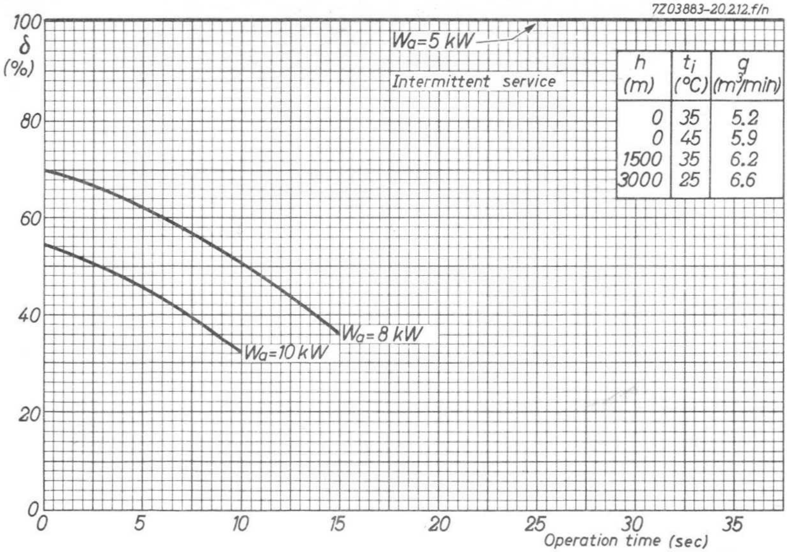
Limits of anode dissipation and cooling, intermittent service.





INDUSTRIAL R.F. POWER TRIODE

- Air cooled

QUICK REFERENCE DATA

Industrial r.f. oscillator, class-C

	three-phase rectifier			
freq.	continuous		intermittent	
	V_a	W_o	V_a	W_o
MHz	kV	kW	kV	kW
50	7	4,85		
	6	4,1	6	5,9

HEATING: direct; thoriated tungsten filament

Filament voltage	V_f	=	6,3 V
Filament current	I_f	=	65 A

The filament is designed to accept temporary fluctuations of +5% and −10%

CAPACITANCES

Anode to all other elements except grid	C_a	<	0,5 pF
Grid to all other elements except anode	C_g	=	13 pF
Anode to grid	C_{ag}	=	7,5 pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	=	6 kV
Anode current	I_a	=	0,24 A
Mutual conductance	S	=	7 mA/V
Amplification factor	μ	=	23

TEMPERATURE LIMITS (Absolute limits)

Temperature of all seals	max.	220 °C
Temperature of external parts of anode	max.	270 °C

COOLING

Continuous service

W_a (kW)	q_{min} (m^3/min)	p_i (mm H_2O)
1.3	1.6	16
1.7	2.1	25

For intermittent service see figure page 113

At higher altitudes and/or temperatures a corresponding higher amount of air should be applied

RECOMMENDED COOLING DEVICE

(1) = metal housing (see page 3)

(2) = glass cylinder

(3) = socket 2422 511 05001

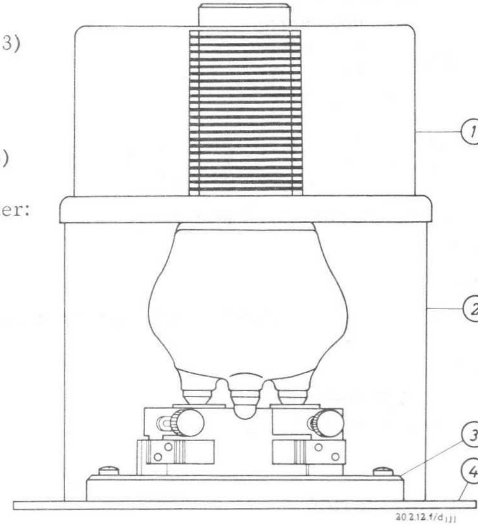
(4) = ground plate (see page 3)

Dimensions of the glass cylinder:

Height : 118 mm

Outside diameter : 150 mm

Inside diameter : 144 mm



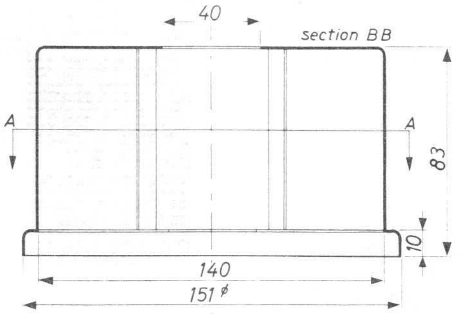
The cooling air should preferably be supplied through the space under the ground plate (4). This ground plate should have holes of sufficient cross section to pass the required air flow.

The housing (1) should be connected to the anode connector. At frequencies above 4 MHz both grid terminals should be connected in parallel. At the highest frequencies care should be taken to distribute the R.F. current equally between both grid terminals to avoid excessive grid seal temperatures.

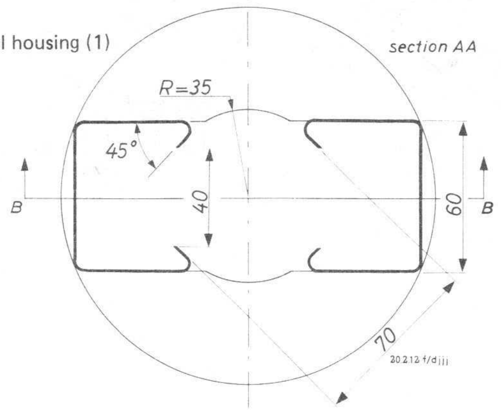
7Z2 8655

RECOMMENDED COOLING DEVICE (continued)

Dimensions in mm



Metal housing (1)



Ground plate (4)

INDUSTRIAL R.F. POWER TRIODE

- Air cooled

QUICK REFERENCE DATA

Industrial r.f. oscillator, class-C

freq.	three phase	
	V_a	W_o
MHZ	kV	kW
30	12	29,0
	10	23,3
	8	17,9

HEATING: direct; thoriated tungsten filament

Filament voltage	V_f	=	8,0 V
Filament current	I_f	=	98 A
Cold filament resistance	R_{fo}	=	0,008 Ω

The filament is designed to accept temporary fluctuations of +5% and −10%

The filament current must never exceed a peak value of 210 A instantaneously at any time during the initial energizing schedule.

CAPACITANCES

Anode to all other elements except grid	C_a	=	0,4 pF
Grid to all other elements except anode	C_g	=	37 pF
Anode to grid	C_{ag}	=	30 pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	=	12 kV
Anode current	I_a	=	2 A
Mutual conductance	S	=	20 mA/V
Amplification factor	μ	=	34

TEMPERATURE LIMIT (Absolute limit)

Seal temperature	max.	220 °C

AIR COOLING CHARACTERISTICS

W_a (kW)	h (m)	t_i (^oC)	q_{min} (m^3/min)	p_i (mm H_2O)

COOLING: water/low-velocity air flow

WATER COOLING CHARACTERISTICS See also the cooling curves

W_a (kW)	T_i (°C)	q_{min} [1]) (l/min)	p_i (atm)
1	20	2.5	0.08
	50	3	0.1
2	20	2.5	0.08
	50	5	0.3
4	20	4	0.18
	50	9	0.9
6	20	6	0.4
	50	14	2.5

It is necessary to direct a low-velocity air flow to the anode and the grid seal at frequencies above 30 MHz
The air flow must be started upon or before application of the filament voltage

TEMPERATURE LIMITS (Absolute limits)

Water inlet temperature	T_i	max.	50	°C
Temperature of seals	T	max.	180	°C

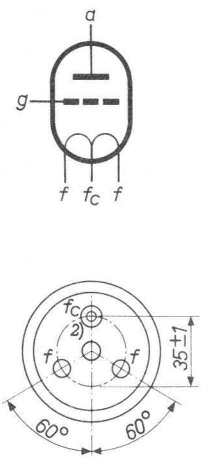
---

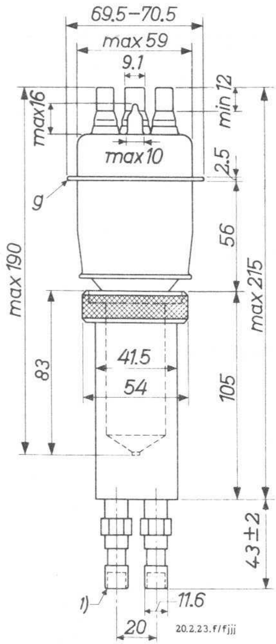
[1]) At inlet temperatures between 20 and 50 °C the required quantity of water can be found by proportional interpolation

MECHANICAL DATA Dimensions in mm

Mounting position: vertical with anode down

Net mass: 0.45 kg





Tube mounted in water jacket K713

The centre tap f_c must not be used for filament current supply. The connectors type 40634, however, must be used for the cooling of all three filament pins, thus also of pin f_c

ACCESSORIES

Grid connector	type	40650 [3]	or	40622
Water jacket		K713		
Filament connector		40634		
"O" ring		3322 026 82801		

[1]) 1/8 in pipe thread

[2]) This pin is marked "O"

[3]) The connector 40650 should be used only below 30 MHz.
When the tube is used with this connector at maximum ratings additional cooling of the grid seals will be required.

[2]) These values are based on measurements on a circuit with a single LC section

[3]) Measured by the slide back method

[4]) Driving power is accounted for largely by circuit losses. The indicated driving power is required to take care of losses in damping resistors, circuit losses and tube driving power

R.F. CLASS C OSCILLATOR FOR INDUSTRIAL USE with anode voltage from three-phase half-wave rectifier without filter

LIMITING VALUES (Absolute limits)

Frequency	f	up to	75	MHz
Anode voltage	V_a	max.	6000	V
Negative grid voltage	$-V_g$	max.	1000	V
Anode current	I_a	max.	1.5	A
Grid current	I_g	max.	0.35	A
Anode input power	W_{ia}	max.	9	kW
Anode dissipation	W_a	max.	6	kW 4)
Grid dissipation	W_g	max.	120	W

OPERATING CONDITIONS

Frequency	f	75	75	MHz

	50	5	0.3
4	20	4	0.18
	50	9	0.9
6	20	6	0.4
	50	14	2.5

TEMPERATURE LIMITS (Absolute limits)

Inlet temperature	T_i	max.	50	°C
Temperature of filament seals		max.	210	°C
Temperature of grid and anode seals		max.	180	°C

ACCESSORIES

Filament connectors	40634
Connector centre pin of filament	40649 2)
Grid connector	40622
Water jacket	K713

In general, no air cooling will be required at frequencies up to 30 MHz **and at** ambient temperatures below 35 °C.
At higher frequencies or at higher ambient temperatures a low-velocity air flow to the grid and filament seals will be necessary.

1) At water inlet temperatures between 20 and 50 °C the required quantity of water can be found by proportional interpolation

2) The centre tap f_c (diameter 10.5 mm; marked O) must not be used for filament current supply. The connector type 40649, however, must be used for the cooling of this pin

INDUSTRIAL R.F. POWER TRIODE

- Water cooled

QUICK REFERENCE DATA

Industrial r.f. oscillator; class-C

freq. MHz	three phase V_a kV	W_o kW
30	12	29,0
	10	23,3
	8	17,9

HEATING: direct; thoriated tungsten filament

Filament voltage	V_f	=	8,0 V
Filament current	I_f	=	98 A
Cold filament resistance	R_{fo}	=	0,008 Ω

The filament is designed to accept temporary fluctuations of +5% and −10%

The filament current must never exceed a peak value of 210 A instantaneously at any time during the initial energizing schedule.

CAPACITANCES

Anode to all other elements except grid	C_a	=	0,4 pF
Grid to all other elements except anode	C_g	=	37 pF
Anode to grid	C_{ag}	=	30 pF

TYPICAL CHARACTERISTICS

Anode voltage	V_a	=	12 kV
Anode current	I_a	=	2 A
Mutual conductance	S	=	20 mA/V
Amplification factor	μ	=	34

TEMPERATURE LIMIT (Absolute limit)

Seal temperature max. 220 °C

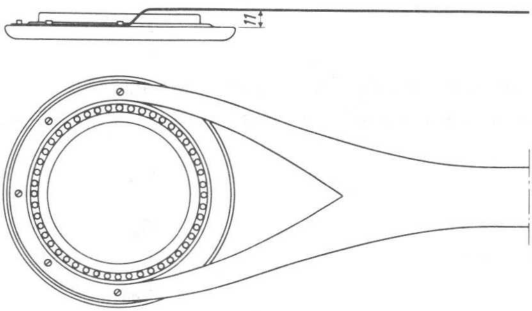
Generally, a low velocity air flow to the seals is required.

WATER COOLING CHARACTERISTICS

t_i = max. 50 °C

W_a (kW)	t_i (°C)	q_{min} [1]) (l/min)	p_i (atm.)
5	20	6	0.02
	50	15	0.22
10	20	11	0.1
	50	25	0.7
15	20	16	0.25
	50	37	1.3
20	20	22	0.5
	50	49	2.3

To ensure a uniform R.F. current distribution in the grid seal especially at frequencies higher than 4 MHz, the grid lead should be connected as shown below.



[1]) At inlet temperatures between 20 and 50 °C the required quantity of water can be found by proportional interpolation

INDUSTRIAL R.F. TRIODES

Triodes in metal-ceramic construction, intended for use as industrial oscillators.
The YD1150A is forced-air cooled, with integral cooler.
The YD1152 has an integral helical water cooler.

QUICK REFERENCE DATA

Oscillator output power ($W_o - W_{feedb}$), typical	W_{osc}		4,75 kW
Frequency for full ratings	f	max.	85 MHz

To be read in conjunction with "General Operational Recommendations".

R.F. CLASS-C OSCILLATOR FOR INDUSTRIAL USE

OPERATING CONDITIONS

Frequency	f	30	30	MHz
Filament voltage	V_f	6,3	6,3	V
Oscillator output power ($W_o - W_{feedb}$)	W_{osc}	4,7	3,8	kW
Anode voltage	V_a	6	5	kV
Anode current	I_a	1	1	A
Anode input power	W_{ia}	6	5	kW
Anode dissipation	W_a	1,1	1,0	kW
Anode output power	W_o	4,9	4	kW
Anode efficiency	η_a	81,5	80	%
Oscillator efficiency	η_{osc}	78	76	%
Feedback ratio	V_{gp}/V_{ap}	17,6	19,4	%
Grid resistor	R_g	3,1	2,75	kΩ
Grid current, on load	I_g	205	200	mA
Grid voltage, negative	$-V_g$	640	550	V
Grid dissipation	W_g	60	60	W
Grid resistor dissipation	W_{Rg}	130	110	W

Note: For operation above 85 MHz the tube manufacturer should be consulted.

LIMITING VALUES (Absolute maximum rating system)

→ Frequency	f	up to	85 MHz*
Anode voltage	V_a	max.	7,2 kV
Anode current	I_a	max.	1,1 A
Anode input power	W_{ia}	max.	6,5 kW
Anode dissipation	W_a	max.	2,5 kW
Grid voltage	$-V_g$	max.	1 kV
→ Grid current, on load	I_g	max.	250 mA
→ off load	I_g	max.	350 mA
Grid dissipation	W_g	max.	140 W
Grid circuit resistance	R_g	max.	20 kΩ
Cathode current, mass	I_k	max.	1,4 A
peak	I_{kp}	max.	7,5 A
Envelope temperature	T_{env}	max.	240 °C

HEATING: direct; thoriated tungsten filament

Filament voltage (< 120 MHz)	V_f	6,3 V
(> 120 MHz)	V_f	6,0 V
Filament current at $V_f = 6,3$ V	I_f	33 A

The filament is designed to accept temporary fluctuations of +5% and −10%.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for R.F. Heating" or contact the manufacturer.

CAPACITANCES

Anode-to-filament	C_{af}	0,4 pF
Grid to filament	C_{gf}	15 pF
Anode to grid	C_{ag}	11 pF

CHARACTERISTICS measured at $V_a = 2,0$ kV, $I_a = 0,5$ A

Transconductance	S	10 mA/V
Amplification factor	μ	17

* For operation above 85 MHz the tube manufacturer should be consulted.

COOLING

See also cooling curves.

To obtain optimum life, the temperature of the seals and the envelope should, under normal operating conditions, be kept below 200 °C.

YD1150A

Grid current, on load	I_g	max.	1	A
off load	I_g	max.	1,5	A
Grid dissipation	W_g	max.	350	W
Grid circuit resistance	R_g	max.	10	kΩ
Cathode current, mean	I_k	max.	5	A
peak	I_{kp}	max.	25	A
Envelope temperature	t_{env}	max.	240	°C

HEATING : direct; thoriated tungsten filament

Filament voltage	V_f		5,8	V
Filament current	I_f		130	A
Peak filament starting current	I_{fp}	max.	800	A
Cold filament resistance	R_{fo}		5,6	mΩ

The filament is designed to accept temporary fluctuations of +5% and -10%.

To ensure that the cathode temperature remains constant irrespective of the operating frequency, it may be necessary to reduce the filament voltage at higher frequencies. When doing so it must be borne in mind that the filament voltage-to-current ratio measured with only the filament voltage applied should remain constant under all operating conditions.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the funamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

Anode to grid	C_{ag}	25	pF

CHARACTERISTICS measured at V_a = 6 kV, I_a = 2 A

Transconductance	S	40	mA/V
Amplification factor	μ	30	

COOLING

To obtain optimum life, the temperature of the seals and of the envelope should, under normal operating conditions, be kept below 200 °C.

To maintain these temperatures additional cooling may be necessary. At frequencies higher than about 4 MHz cooling of the seals becomes mandatory.

YD1170

AIR COOLED R.F. INDUSTRIAL TRIODE

Forced air cooled triode of metal-ceramic construction with integral cooler intended for use as an industrial oscillator.

QUICK REFERENCE DATA				
Oscillator output power (W_o-W_{feedb}), typical	W_{osc}		13.22	kW
Frequency fur full ratings	f	max.	50	MHz

To be read in conjuction with "General Recommendations Transmitting tubes. Tubes for R.F. heating".

R.F. CLASS C OSCILLATOR FOR INDUSTRIAL USE

OPERATING CONDITIONS

Frequency	f	50	MHz
Oscillator output power (W_o-W_{feedb})	W_{osc}	13.22	kW
Anode voltage	V_a	10.0	kV
Anode current	I_a	1.75	A
Anode input power	W_{ia}	17.5	kW
Anode dissipation	W_a	3.8	kW
Anode output power	W_o	13.7	kW
Anode efficiency	η_a	78.3	%
Oscillator efficiency	η_{osc}	75.6	%
Feedback ratio	V_{gp}/V_{ap}	12.0	%
Grid resistor	R_g	1.5	kΩ
Grid current, on load	I_g	450	mA
Grid voltage, negative	$-V_g$	675	V
Grid dissipation	W_g	180	W
Grid resistor dissipation	W_{Rg}	304	W

LIMITING VALUES (Absolute max. rating system)

Frequency for full ratings	f	up to	50	MHz
Anode voltage	V_a	max.	12	kV
Anode current	I_a	max.	2.0	A
Anode input power	W_{ia}	max.	20	kW
Anode dissipation	W_a	max.	10	kW
Grid voltage	$-V_g$	max.	1.5	kV
Grid current, on load	I_g	max.	0.6	A
off load	I_g	max.	0.8	A
Grid dissipation	W_g	max.	250	W
Grid circuit resistance	R_g	max.	10	kΩ
Cathode current, mean	I_k	max.	2.5	A
peak	I_{kp}	max.	10	A
Envelope temperature	t_{env}	max.	240	^oC

HEATING : direct; filament thoriated tungsten

Filament voltage	V_f		5.4	V
Filament current	I_f		65	A
Peak filament starting current	I_{fp}	max.	400	A
Cold filament resistance	R_{fo}		10	mΩ

The filament is designed to accept temporary fluctuations of +5% and −10%.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Appication Book "Tubes for R.F. heating" or contact the manufacturer.

CAPACITANCES

Anode to filament	C_{af}	0.4	pF
Grid to filament	C_{gf}	42	pF
Anode to grid	C_{ag}	17	pF

→ **CHARACTERISTICS** measured at V_a = 10 kV, I_a = 1 A

Transconductance	S	22	mA/V
Amplification factor	μ	45	

COOLING

See also cooling curves.

With insulating pedestal type 40654.

Anode + grid dissipation $W_a + W_g$ (kW)	Altitude h (m)	Inlet temperature t_i (°C)	Rate of flow qmin (m^3/min)	Pressure drop P_i (Pa)*	Outlet temperature t_o (°C)

INDUSTRIAL R.F. TRIODE

Forced-air cooled triodes in metal-ceramic construction intended for use as industrial oscillators.

QUICK REFERENCE DATA

Oscillator output power ($W_o - W_{feedb}$)	W_{osc}		30	kW
Frequency for full ratings	f	max.	50	MHz ←

To be read in conjunction with "General Operational Recommendations Transmitting Tubes for Communication; Tubes for r.f. Heating".

R.F. CLASS C OSCILLATOR FOR INDUSTRIAL USE

OPERATING CONDITIONS

Frequency	f	30	30	MHz
Oscillator output power ($W_o - W_{feedb}$)	W_{osc}	25,7	30,3	kW
Anode voltage	V_a	10	10	kV
Anode current	I_a	3,4	4,0	A
Anode input power	W_{ia}	34	40	kW
Anode dissipation	W_a	7,6	9,2	kW
Anode output power	W_o	26,4	30,8	kW
Anode efficiency	η_a	77,6	77,0	%
Oscillator efficiency	η_{osc}	75,6	75,8	%
Feedback ratio	V_{gp}/V_{ap}	12	10	%
Grid resistor	R_g	1440	900	Ω
Grid current, on load	I_g	600	690	mA
Grid voltage, negative	$-V_g$	864	621	V ←
Grid dissipation	W_g	150	180	W
Grid resistor dissipation	W_{Rg}	518	428	W

LIMITING VALUES (Absolute maximum rating system)

Frequency	f	up to	120 MHz*
Anode voltage	V_a	max.	12 kV
Anode current	I_a	max.	5 A
Anode dissipation	W_a	max.	10 kW
Grid voltage	$-V_g$	max.	1,8 kV
Grid current, on load	I_g	max.	1 A
off load	I_g	max.	1,5 A
Grid dissipation	W_g	max.	300 W
Grid circuit resistance	R_g	max.	10 kΩ
Cathode current, mean	I_k	max.	6 A
peak	I_{kp}	max.	25 A
Envelope temperature	T_{env}	max.	240 °C

HEATING: direct; thoriated tungsten filament

Filament voltage	V_f		5,8 V
Filament current	I_f		130 A
Peak filament starting current	I_{fp}	max.	800 A
Cold filament resistance	R_{fo}		5,6 mΩ

The filament is designed to accept temporary fluctuations of +5% and −10%.

To ensure that the cathode temperature remains constant irrespective of the operating frequency, it may be necessary to reduce the filament voltage at higher frequencies. When doing so it must be borne in mind that the filament voltage-to-current ratio measured with only the filament voltage applied should remain constant under all operating conditions.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed, by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for r.f. heating" or contact the manufacturer.

CAPACITANCES

Anode to filament	C_{af}	1 pF
Grid to filament	C_{gf}	47 pF
Anode to grid	C_{ag}	25 pF

* When the tube is to be used at frequencies above 50 MHz the manufacturer should be consulted for more detailed information.

CHARACTERISTICS measured at V_a = 6 kV, I_a = 2 A

Transconductance	S	55 mA/V
Amplification factor	μ	24

COOLING

To obtain optimum life, the temperature of the seals and of the envelope should, under normal operating conditions, be kept below 200 °C.

To maintain these temperatures additional cooling may be necessary. At frequencies higher than about 4 MHz cooling of the seals becomes mandatory.

INDUSTRIAL R.F. TRIODE

Triode in metal-ceramic construction intended for use as industrial oscillator. The YD1192 has an integral water cooler.

QUICK REFERENCE DATA

Oscillator output power ($W_o - W_{feedb}$)	W_{osc}		62,7	kW
Frequency for full ratings	f	max	100	MHz

To be read in conjunction with "General Operational Recommendations Transmitting Tubes for Communication; Tubes for R.F. Heating".

R.F. CLASS-C OSCILLATOR FOR INDUSTRIAL USE

OPERATING CONDITIONS

Frequency	f	30	MHz
Oscillator output power ($W_o - W_{feedb}$)	W_{osc}	62,7	kW
Anode voltage	V_a	8	kV
Anode current	I_a	10	A
Anode input power	W_{ia}	80	kW
Anode dissipation	W_a	15	kW
Anode output power	W_o	65	kW
Anode efficiency	η_a	81,2	%
Oscillator efficiency	η_{osc}	78,4	%
Feedback ratio	V_{gp}/V_{ap}	14,6	%
Grid resistor	R_g	300	Ω
Grid current, on load	I_g	2,25	A
Grid voltage, negative	$-V_g$	675	V
Grid dissipation	W_g	750	W
Grid resistor dissipation	W_{Rg}	1,52	kW

LIMITING VALUES (Absolute maximum rating system)

Frequency for full ratings	f	up to	100 MHz *
Anode voltage	V_a	max	9,6 kV
Anode current	I_a	max	12 A
Anode input power	W_{ia}	max	96 kW
Anode dissipation	W_a	max	40 kW
Grid voltage	$-V_g$	max	1,5 kV
Grid current, on load	I_g	max	2,5 A
Grid current, off load	I_g	max	3,5 A
Grid dissipation	W_g	max	1 kW
Grid circuit resistance	R_g	max	10 kΩ
Cathode current, mean	I_k	max	14 A
Cathode current, peak	I_{kp}	max	70 A
Envelope temperature	t_{env}	max	240 °C

HEATING: direct; thoriated tungsten filament

Filament voltage	V_f		8,4 V
Filament current	I_f		235 A
Peak filament starting current	I_{fp}	max	1500 A
Cold filament resistance	R_{fo}		3,9 mΩ

The filament is designed to accept temporary fluctuations of +5% and −10%.

To ensure that the cathode temperature remains constant irrespective of the operating frequency, it may be necessary to reduce the filament voltage at higher frequencies. When doing so it must be borne in mind that the filament voltage-to-current ratio measured with only the filament voltage applied should remain constant under all operating conditions.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-to-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

* When the tube has to be used at frequencies above 30 MHz the manufacturer should be consulted for more detailed information.

CAPACITANCES

Anode to filament	C_{af}	1,3 pF
Grid to filament	C_{gf}	100 pF
Anode to grid	C_{ag}	45 pF

CHARACTERISTICS measured at V_a = 8 kV, I_a = 6 A

Transconductance	S	90 mA/V
Amplification factor	μ	35

COOLING

To obtain optimum life, the temperature of the seals and the envelope should, under normal operating conditions, be kept below 200 °C. At low frequencies the seals are sufficiently cooled when the filament connectors are water cooled by a flow of about 0,5 ℓ/min. At higher frequencies, however, an additional air flow of about 1 m^3/min must be led along the seals from a 30 mm diameter nozzle positioned at a distance of 200 mm from the tube header.

COOLING

To obtain optimum life, the seal/envelope temperature under normal operating conditions should be kept below 200 °C.

At low frequencies the seals are sufficiently cooled if the filament connectors are water-cooled by a flow of about 0,5 ℓ/min. At higher frequencies, however, an additional air flow of about 4 m^3/min must be led along the seals from a 50 mm diameter nozzle positioned at a distance of 250 mm from the tube header.

AIR-COOLED R.F. INDUSTRIAL TRIODES

Air-cooled triodes of metal-ceramic construction with integral cooler intended for use as industrial oscillators.

QUICK REFERENCE DATA

Oscillator output power (W_o-W_{feedb}), typical	W_{osc}		2,67	kW
Frequency for full ratings	f	max.	250	MHz

To be read in conjunction with "General Recommendations Transmitting tubes, Tubes for R.F. heating".

R.F. CLASS-C OSCILLATOR FOR INDUSTRIAL USE

OPERATING CONDITIONS

Frequency	f	160	27,12	MHz
Filament voltage	V_f	6,0	6,3	V
Oscillator output power (W_o-W_{feedb})	W_{osc}	2,22	2,67	kW
Anode voltage	V_a	4,5	5,0	kV
Anode current	I_a	700	750	mA
Anode input power	W_{ia}	3,15	3,75	kW
Anode dissipation	W_a	0,75	0,83	kW
Anode output power	W_o	2,4	2,9	kW
Anode efficiency	η_a	76	78	%
Oscillator efficiency	η_{osc}	71	71	%
Feedback ratio	V_{gp}/V_{ap}	17	17	%
Grid resistor	R_g	2,2	2,2	kΩ
Grid current, on load	I_g	225	235	mA
Grid voltage, negative	$-V_g$	495	517	V
Grid dissipation	W_g	70	80	W
Grid resistor dissipation	W_{Rg}	111	121	W

LIMITING VALUES (Absolute maximum rating system)

Frequency for full ratings	f	up to	250 MHz
Anode voltage	V_a	max.	5,5 kV
Anode current	I_a	max.	1,1 A
Anode input power	W_{ia}	max.	6,0 kW
Anode dissipation	W_a	max.	1,5 kW
Grid voltage	$-V_g$	max.	1,0 kV
Grid current			
on load	I_g	max.	280 mA
off load	I_g	max.	400 mA
Grid dissipation	W_g	max.	150 W
Grid circuit resistance	R_g	max.	20 kΩ
Cathode current			
mean	I_k	max.	1,4 A
peak	I_{kp}	max.	8 A
Envelope temperature	t_{env}	max.	240 °C

HEATING: direct; filament thoriated tungsten

Filament voltage		
$f \leq 120$ MHz	V_f	6,3 V
$f > 120$ MHz	V_f	6,0 V
Filament current at V_f = 6,3 V	I_f	33 A

The filament is designed to accept temporary fluctuations of + 5% and −10%.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounded-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book "Tubes for R.F. heating" or contact the manufacturer.

CAPACITANCES

Anode to filament	C_{af}	0,4 pF
Grid to filament	C_{gf}	17 pF
Anode to grid	C_{ag}	14 pF

CHARACTERISTICS measured at V_a = 2,0 kV, I_a = 0,5 A

Transconductance	S	10 mA/V
Amplification factor	μ	20

COOLING

See cooling curves.

A low velocity air flow directed to the seals may be required.

To obtain optimum life, the temperature of the seals and of the envelope should, under normal operating conditions, be kept below 200 °C.

To maintain these temperatures additional cooling may be necessary. At frequencies higher than about 4 MHz cooling of the seals becomes mandatory.

Filament current	I_f		555 A
Peak filament starting current	I_{fp}	max.	3500 A
Cold filament resistance	R_{fo}		2,6 mΩ

The filament is designed to accept temporary fluctuations of + 5% and – 10%.

It is extremely important that the filament be properly decoupled. This should be so done that the resonance of the circuit formed by the filament and decoupling elements remains below the fundamental oscillator frequency. In grounde-grid circuits this resonance should be below the grid-cathode resonance. For further information please see Application Book *"Tubes for R.F. heating"* or contact the manufacturer.

CAPACITANCES

Anode to filament	C_{af}	4,5 pF
Grid to filament	C_{gf}	250 pF
Anode to grid	C_{ag}	70 pF

CHARACTERISTICS

Measured at V_a = 16 kV, I_a = 18 A

Transconductance	S	230 mA/V
Amplification factor	μ	35

COOLING

To obtain optimum life, the temperature of the seals and of the envelope should, under normal operating conditions, be kept below 200 °C.

At low frequencies the seals are sufficiently cooled if the filament connectors are water-cooled by a flow of about 1 l/min. At high frequencies, however, an additional air flow of about 6 m^3/min must be led along the seals from a 60 mm diameter nozzle positioned at a distance of 300 mm from the tube header.

Material: brass, nickel plated
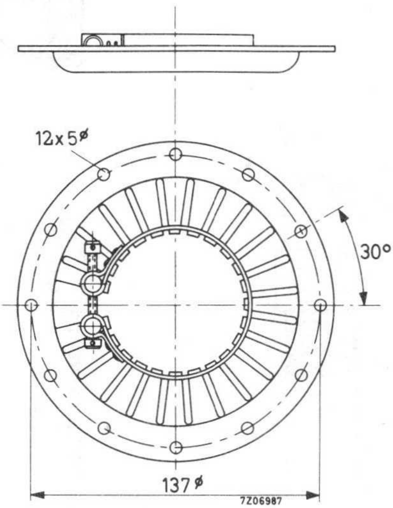
Net mass: 55 g

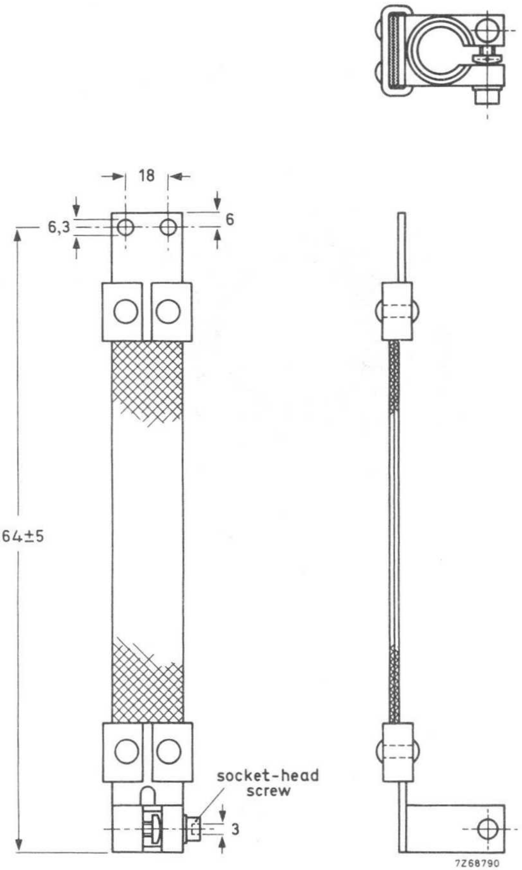
GRID CONNECTOR
for 66 mm dia. terminals



Material: brass, silver plated
Net mass: 240 g

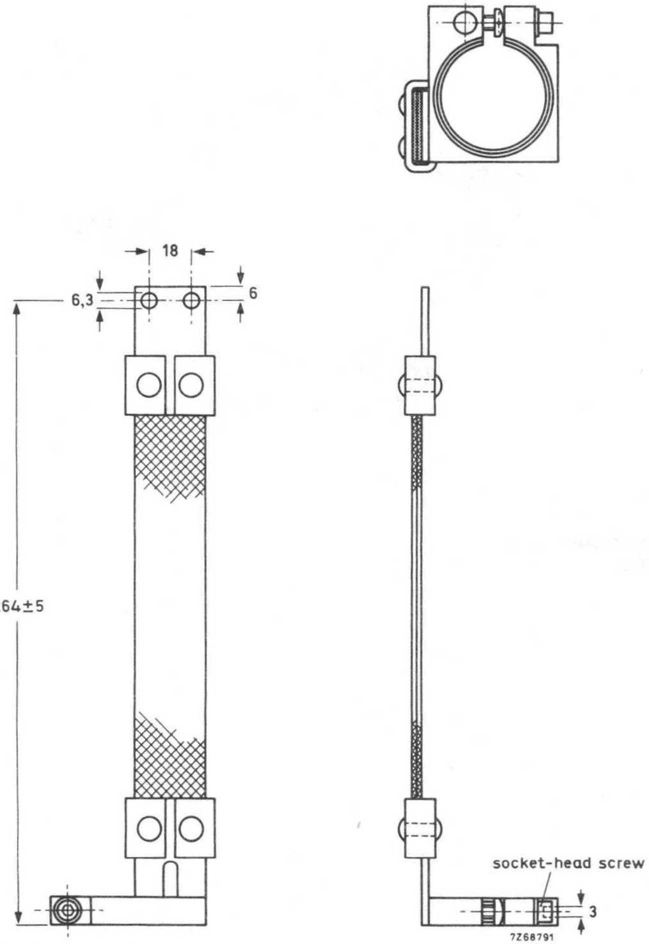
FILAMENT CONNECTOR

for 25 mm dia. terminals



Net mass: ≈ 450 g
Material: cable – braided copper
connector – brass, nickel plated

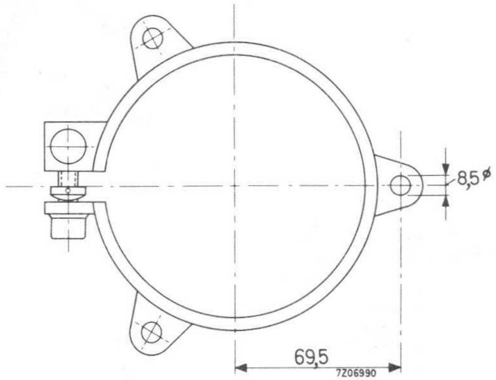
FILAMENT CONNECTOR
for 50 mm dia. terminals



Net mass: ≈ 480 g
Material: cable – braided copper
connector – brass, nickel plated

GRID CONNECTOR

for 112 mm dia. terminals

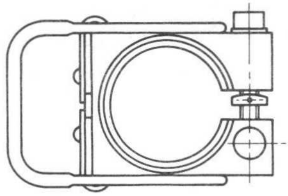


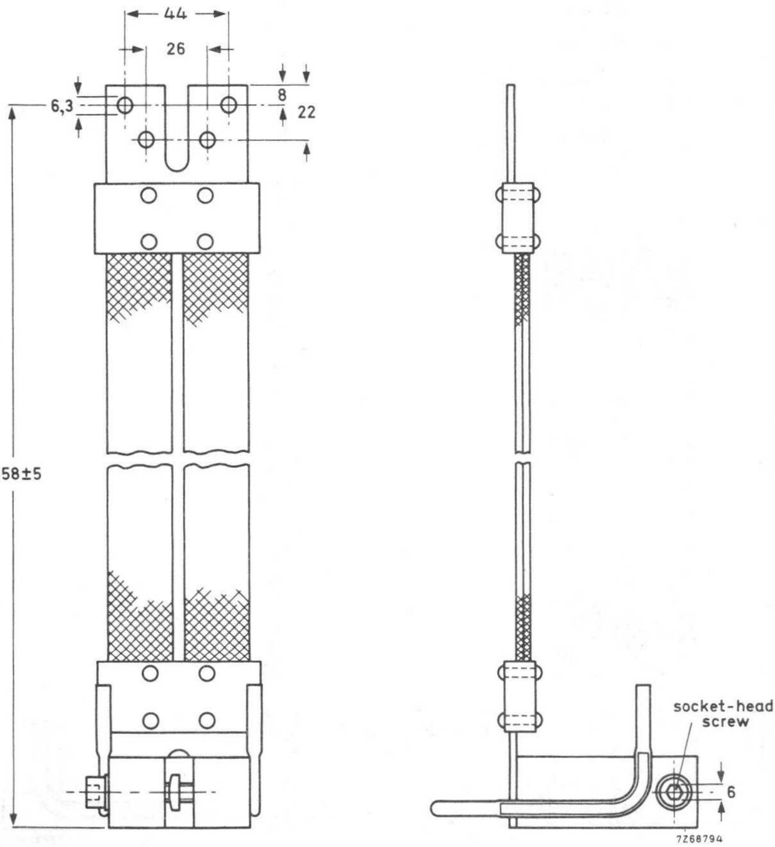
Material: brass, nickel plated
Net mass: 270 g

WATER-COOLED FILAMENT CONNECTOR

for 54 mm dia. terminals

Net mass: ≈ 1380 g
Material: cable — braided copper
connector — brass, nickel plated

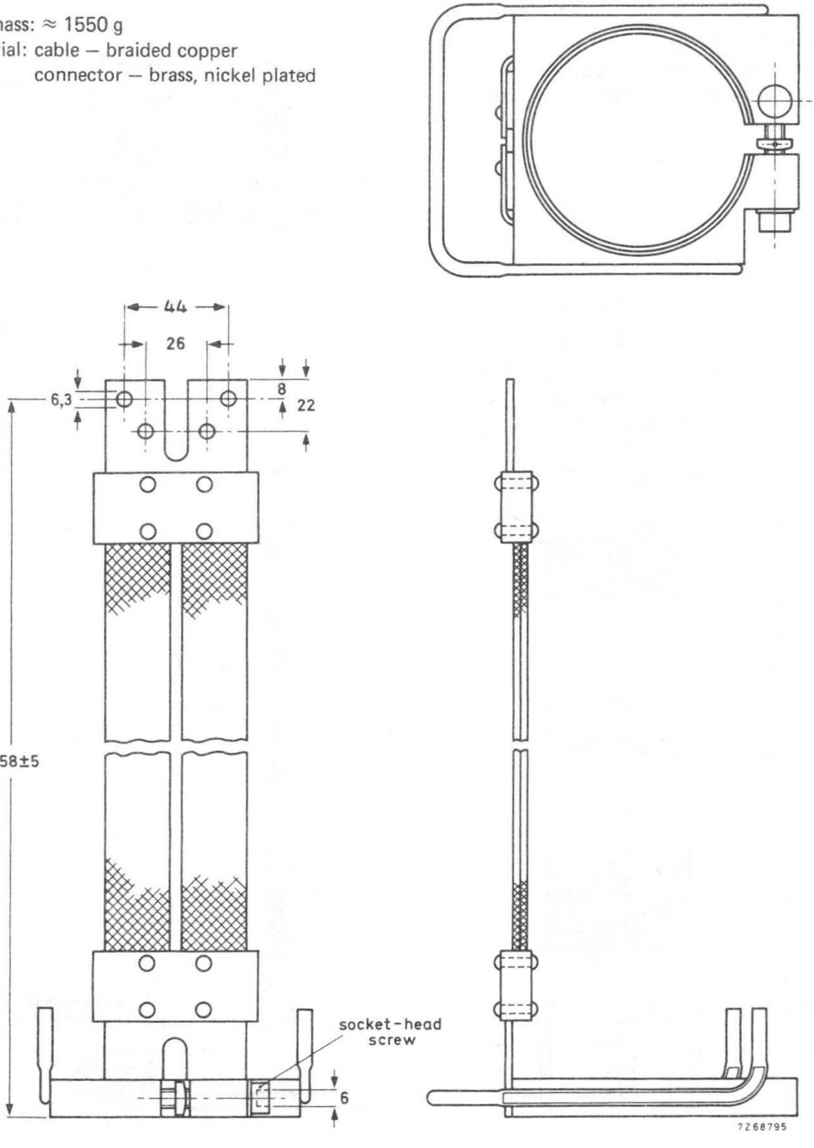




WATER-COOLED FILAMENT CONNECTOR

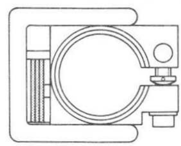
for 96 mm dia. terminals

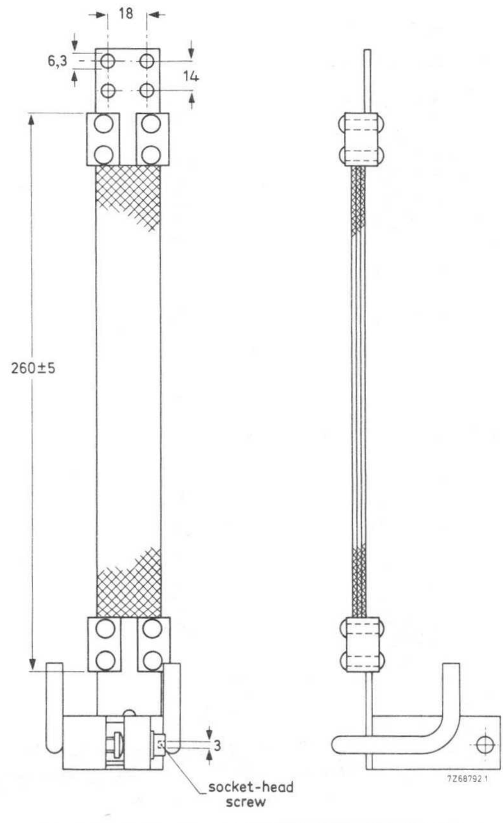
Net mass: ≈ 1550 g
Material: cable – braided copper
connector – brass, nickel plated



FILAMENT CONNECTOR
for 42 mm dia. terminals

Net mass: ≈ 700 g
Material: cable — braided copper
connector — brass, nickel plated

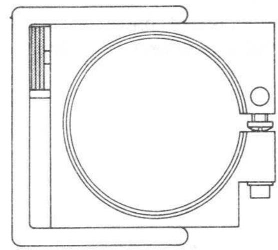


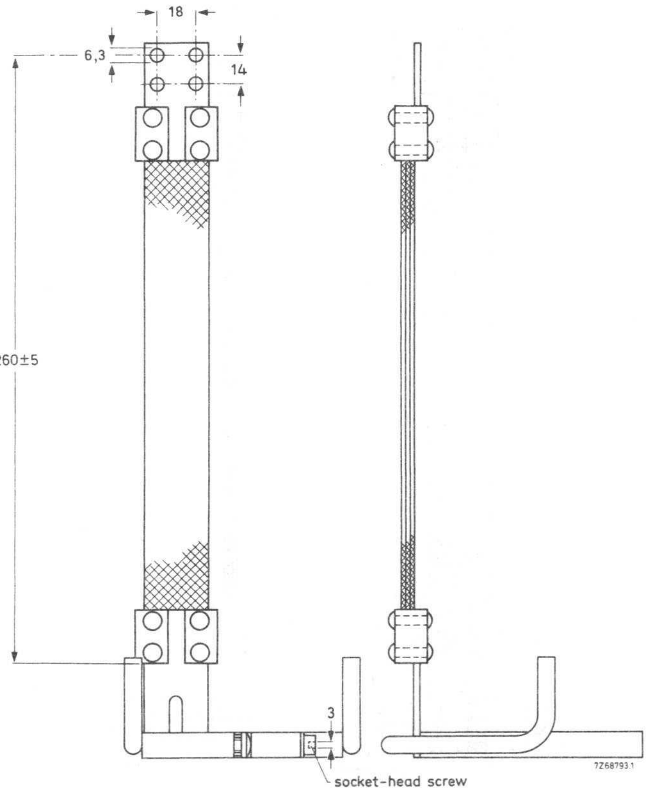


FILAMENT CONNECTOR

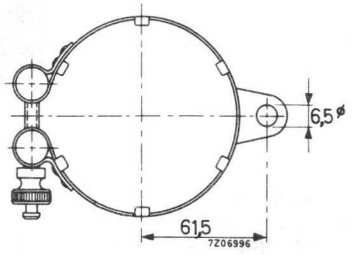
for 86 mm dia. terminals

Net mass: ≈ 830 g
Material: cable — braided copper
connector — brass, nickel plated



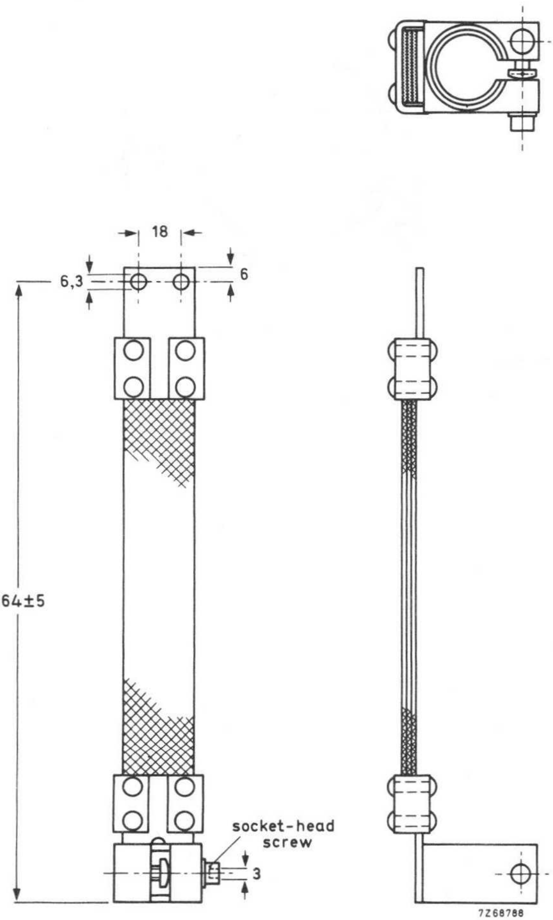


GRID CONNECTOR
for 105 mm dia. terminals



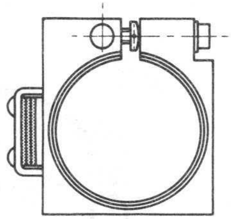
Material: brass, nickel plated

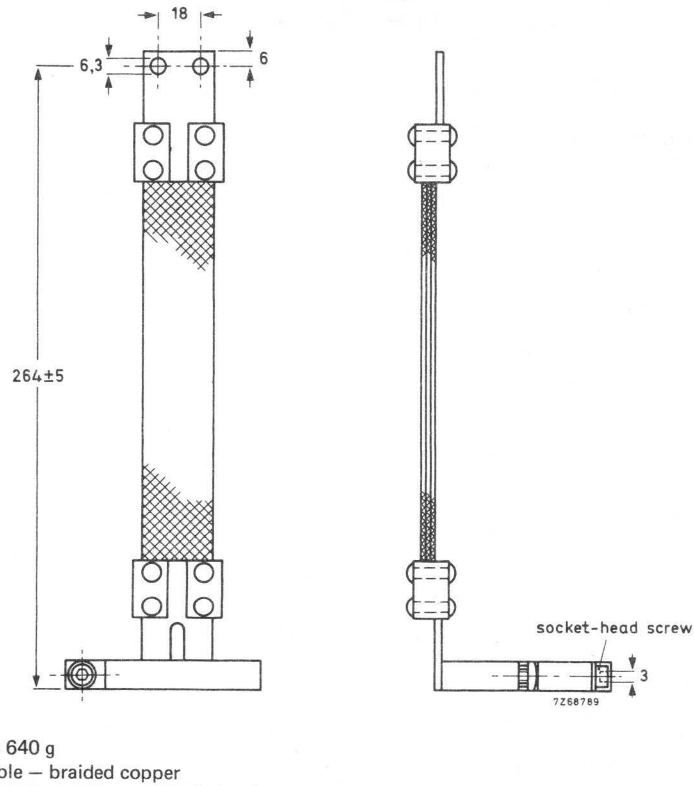
FILAMENT CONNECTOR
for 32 mm dia. terminals



Net mass: ≈ 600 g
Material: cable – braided copper
connector – brass, nickel plated

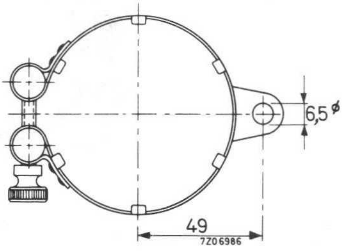
FILAMENT CONNECTOR
for 66 mm dia. terminals





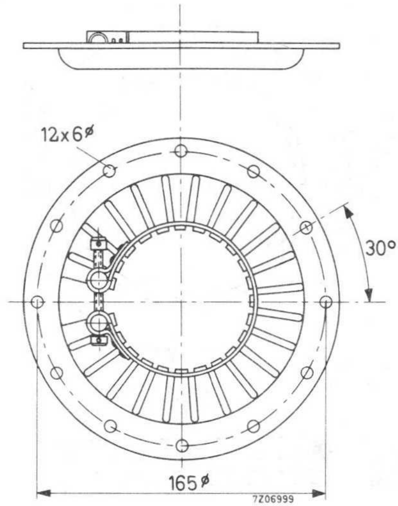
Net mass: ≈ 640 g
Material: cable – braided copper
connector – brass, nickel plated

GRID CONNECTOR
for 80 mm dia. terminals



Material: brass, nickel plated
Net mass: 60 g

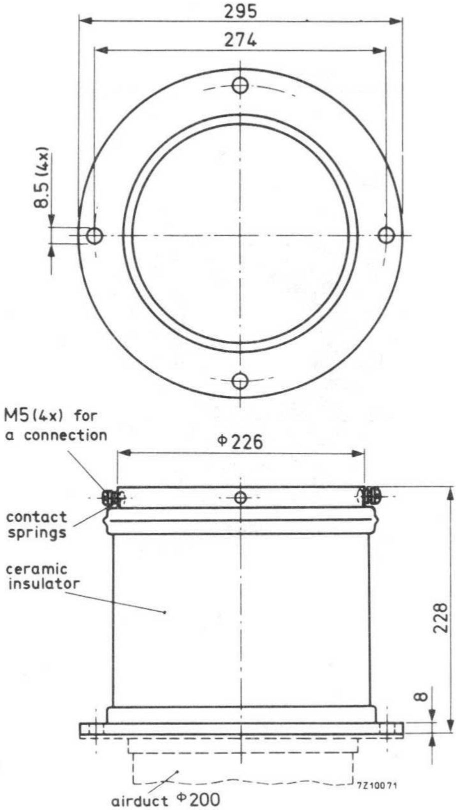
GRID CONNECTOR
for 80 mm dia. terminals



Material: brass, silver plated

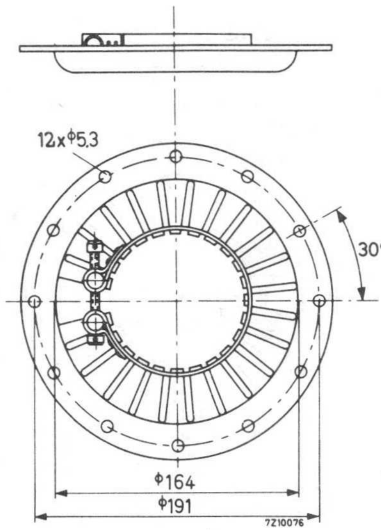
Net mass: 310 g

INSULATING PEDESTAL



Net mass: approx. 8,2 kg

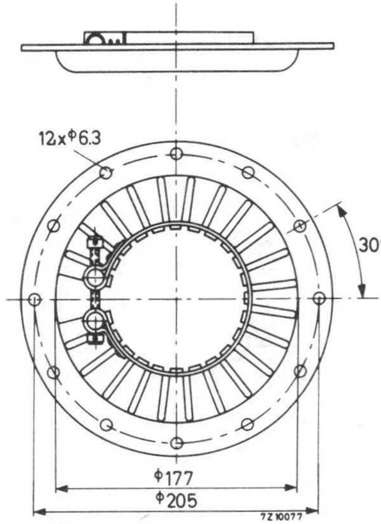
GRID CONNECTOR
for 105 mm dia. terminals



Material: brass, silver plated

Net mass: 450 g

GRID CONNECTOR
for 112 mm dia. terminals



Material: brass, silver plated

Net mass: 525 g
