MOUNTING POSITION

The tube socket should not be rigidly mounted but should have flexible leads and be allowed to move freely. The bottom circumference of the base shell will fall within a circle of 40mm diameter which is centred upon the perpendicular from the centre of the face.

This tube is fitted with a pin protector in order to avoid damage to the glass base due to bending of the base pins whilst handling the tube.

It is advisable to keep this pin protector on the base until it can be replaced by the socket after installation of the tube in any equipment.

RATINGS (DESIGN CENTRE SYSTEM)

V_{a2+a4} max. (at $I_{a2+a4} = 0$) (see note 1)	20	kV

Z_{g-k} max. ($f = 50c/s$)	500	$k\Omega$

1. Adequate precautions should be taken to ensure that the receiver is protected from damage which may be caused by a possible high voltage flashover within the cathode ray tube.
2. Maximum pulse duration 22% of one cycle with a maximum of 1.5ms.
3. The d.c. value of bias must not be such as to allow the grid to become positive with respect to the cathode, except during the period immediately after switching the receiver on or off when it may be allowed to rise to +2V.
It is advisable to limit the positive excursion of the video signal to +5V(pk) max. This may be achieved automatically by the series connection of a $10\text{k}\Omega$ resistor.
4. During an equipment warm-up period not exceeding 15 seconds $v_{h-k}(pk)$ max. (cathode positive) is allowed to rise to 410V. Between 15 and 45 seconds after switching on a decrease in $v_{h-k}(pk)$ max. (cathode positive) proportional with time from 410V to 250V is permissible.
5. The metal band (B) must be connected to the chassis via a $2\text{M}\Omega$ resistor.
The mounting lugs have electrical contact with the metal band.

WARNING

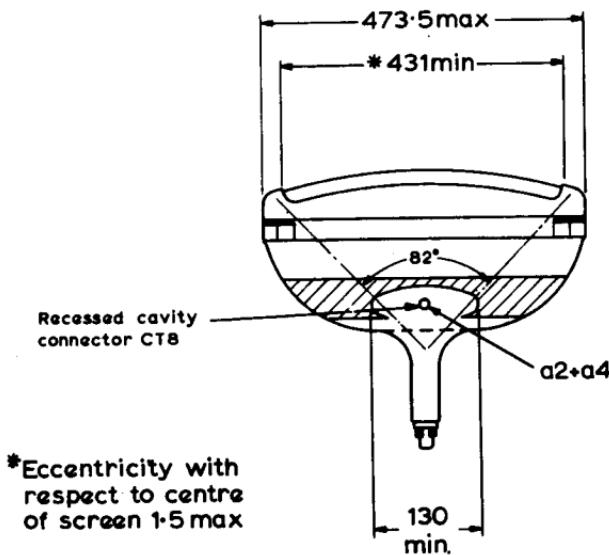

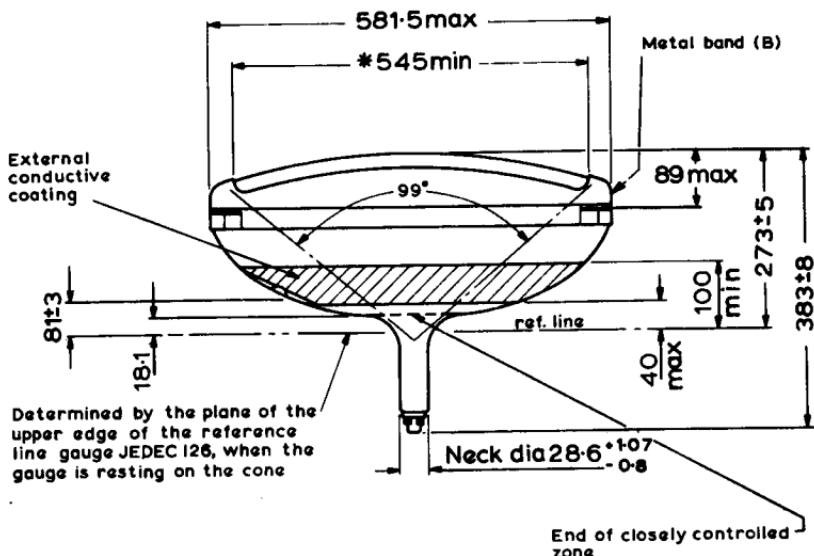

X-ray shielding is advisable to give protection against possible danger of personal injury arising from prolonged exposure at close range to this tube when operated above 20kV.
