

TH 8902 DIRECT VIEW STORAGE TUBE FOR STORAGE OSCILLOSCOPE

- VARIABLE PERSISTENCE
 - HIGH WRITING SPEED
- 8 x 10 DIVISIONS ILLUMINABLE GRATICULE
 - FLAT RECTANGULAR FACEPLATE
 - 100 MHz BANDWIDTH
 - BURN RESISTANT

The TH 8902 is a direct view storage tube having a rectangular faceplate, especially designed for high frequency (100 MHz bandwidth) storage oscilloscope applications.

The flat screen (P31 phosphor) includes a 8 x 10 divisions internal illuminable graticule. The two flood guns symetrically located with respect to the tube axis enable to obtain bright display of information over the entire useful area. The writing gun features high resolution and high deflection sensitivity.

The TH 8902 is suitable for storage oscilloscope application being able to display stored information with or without persistence and non-stored information.

TYPICAL PERFORMANCE

Writing speed* (Note 14)	100	cm/µs
Linewidth at center		mm
Viewing time* (see page 4)		variable
Luminance*	400	cd.m ⁻²

^{*} These values being closely corelated can be adjusted within a wide range depending on specific applications.

GENERAL CHARACTERISTICS

Electrical

- FLOOD GUNS

Number	2
Heater voltage (D.C.)	V
Heater current	Α

- WRITING GUN

Heater voltage	6. 3 V
Heater current	0.6 A
Focusing method ele	ctrostatic
Deflection method ele	ctrostatic

- INTERELECTRODE CAPACITANCE			
g1 to all other electrodes,		45	_
k to all other electrodes		15 p

cathode current

grid g₂ current

REMARKS:

- 1 A high permeability shield (mumetal) is necessary to protect the tube against external electrostatic and magnetic fields.
- 2 For the writing gun, a heater transformer with insulated secondary coil must be used (4 kV insulation minimum).

PERFORMANCE

i - Non-store mode

Resolution (Note 9)	0. 4 mm 9 mm
Deflection sensitivity:	
- x plates deflection factor (Note 14) 10 V ± 10 9	6 per division
- y plates deflection factor (Note 14)	6 per division
- deflection factor uniformity	see Note 11
Trace alignment	see Note 12
Pattern distortion	see Note 13

II - Store mode

- MAXIMUM LUMINANCE

The luminance for a saturated written trace is over 400 cd.m⁻².

- WRITING SPEED (Note 14)

100 cm/ μ s speed (the background is not dark but the contrast is sufficient to make the trace visible).

- VIEWING TIME

The viewing time mentioned in the following table is given as a function :

- 1 of the writing speed (0. 1 div/ μ s 5 div/ μ s 100 div/ μ s)
- 2 of the duty rate of the flood gun; when the duty rate decreases, the viewing time increases with resulting in loss of luminance.

Example of duty rate of flood guns	1		1/3			1/10			
Writing speed (div/μs)	0. 1	5	100	0. 1	5	100	0. 1	4	100
Typical viewing time*	1 mn	20 s	10 s	3 mn	1 mn	30 s	10 mn	3 mn	100 s

^{*} Time beyond which the written trace cannot be discerned on the background.

- VARIABLE PERSISTENCE

Depending on the rate and duration of pulses applied to the backing electrode g6', required visual output decay can be adjusted from 0. 2 s to the values indicated in the table above.

- LONG TERM

When the flood beams are cut off and the screen voltage at 0 V potential, the written information is not degraded by ion charging and can be stored for up to many days.

NOTES

- 1 The two flood gun cathodes are to be separately adjusted in order to obtain the best uniformity.
- 2 The g2' and g3' voltages are to be adjusted in order to obtain the best uniformity.
- 3 In the long-storage mode, g2' voltage is set at -6 V, then a positive pulse train of 26 to 46 V amplitude is applied.
- 4 In store mode, the g6' voltage must never exceed 8 V. The impedance of the g6' circuit must be as low as possible and not exceed 1000 Ω .
- 5 In variable persistence mode, a positive pulse train of 4 V amplitude is applied to grid g6'.
- 6 In erase mode, the grid g6' potential must be raised from store-mode potential (i.e. 1 to 3 V) to +1500 V for about 1 second and then be returned to its store-mode potential. A positive pulse of 12 V amplitude maximum is then applied for 500 milliseconds.
- 7 In changing the operating from the "non-store" to the "store" mode, the g6' voltage must be raised from -30 V to the proper positive voltage (1 to 3 V) in 2 seconds. This will prevent the storage surface to be damaged.
- ${f 8}$ To avoid permanent damage to the tube, insert a 30 M Ω minimum resistance in series in the supply circuit of g7' screen.
- 9 Measurement is made by the shrinking raster method with a beam current of 5 μA. The linewidth is 0.4 mm max, at center and does not exceed 0.8 mm on any point of the useful screen area.
- 10 Distance of the focused and undeflected spot from geometric center of the screen.
- 11 Measurement is made according to "I.E.C." specifications.
- 12 Angle between x and y traces is adjusted by means of the orthogonality coil. Angle between x trace and the horizontal axis of graticule is adjusted by using the rotation coil.
- 13 Vertical and horizontal traces must fall within the boundaries of the two following squares centered on the screen :
 - outer square: 8 x 8 divisions central square on the graticule (72 mm x 72 mm);
 - inner square: 70 mm x 70 mm (sides parallel to outer square).

Because of the width of the trace, only one edge of the trace is to be taken into account.

14 - The limiting writing speed measured in normal ambient lighting conditions is 100 cm/μs. It is defined as the limiting discernibility of the trace on a slightly luminous background. The writing speed can reach 200 or 300 cm/μs in particular viewing conditions : optimum adjustment of the storage mesh potential, low ambient light level.

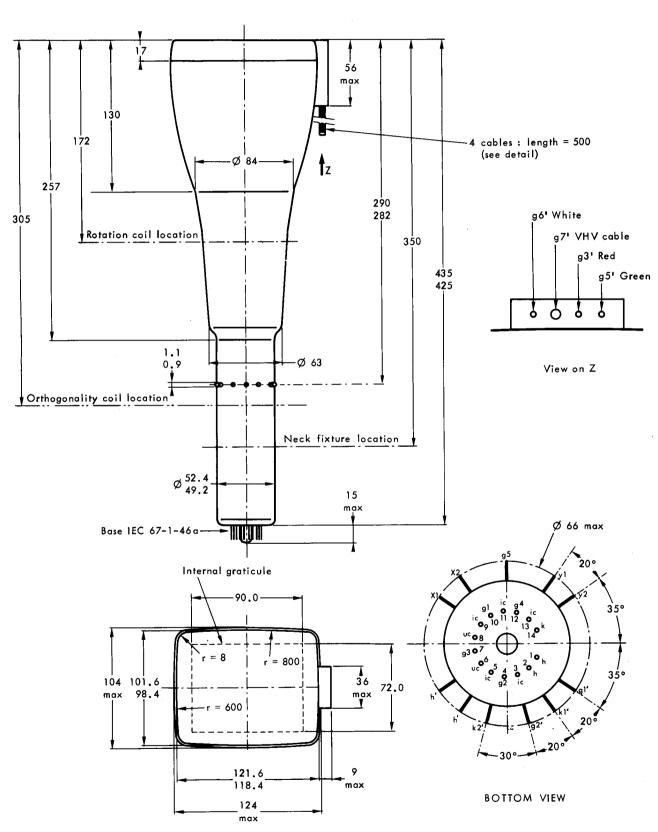

In addition, this limiting writing speed can be further multiplied by a factor of 2 or 3 by doubling the acceleration voltage of the writing gun ($V_k = -3400 \text{ V}$). In this case :

 $S_X = 20 V \pm 10 \%$ per division

 $s_y = 9.4 \text{ V} \pm 10 \text{ \%}$ per division
